Automating Work with Make

Focusing on Satisfaction Survey Analysis

Nov. 4, 2026 · Prof. DY Kwon · AI-based BPA · Week 10

1. Scenario — Event Survey

The event is over.
Send a survey to 300 participants.

Analyze the answers
and draw great charts.

Write the report
and share it with your team and manager.

2. Let´s Break the Work into Steps

1. Survey → analyze → chart · report → share
2. Proposal feedback · event satisfaction · demand surveys

Let's split one task into steps.

3. We Use a Different Program for Each Step

Survey: Google Forms · results: Sheets

Report: Google Docs · sending: Gmail

Now let's automate this.

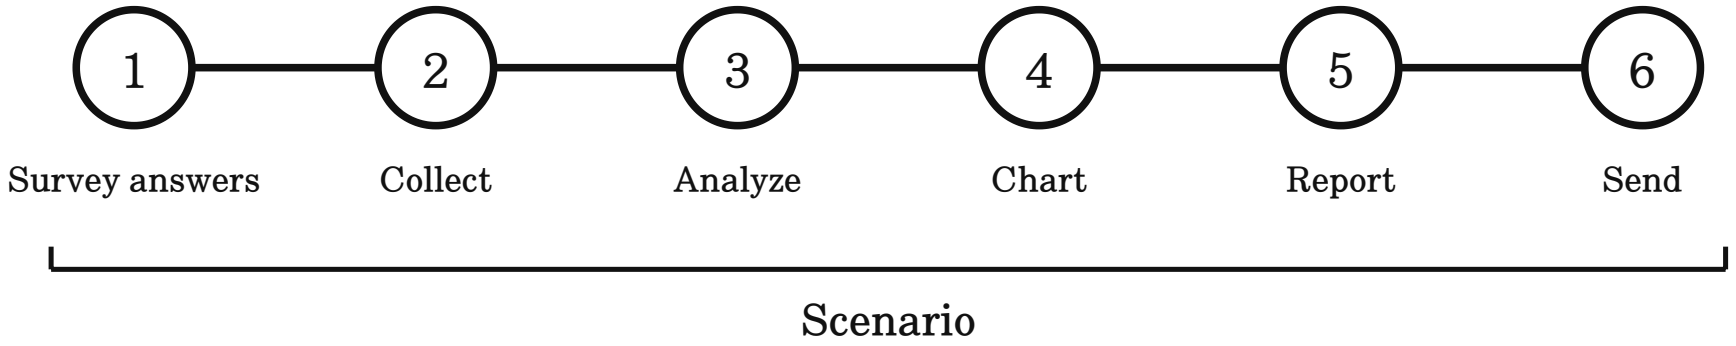

4. Today's Tool — Make

Many ways to automate · today: Make

2016 Czech "Integromat" → 2022 "Make" · 3,000 apps · 1,000 free runs a month

Non-experts automating without coding.

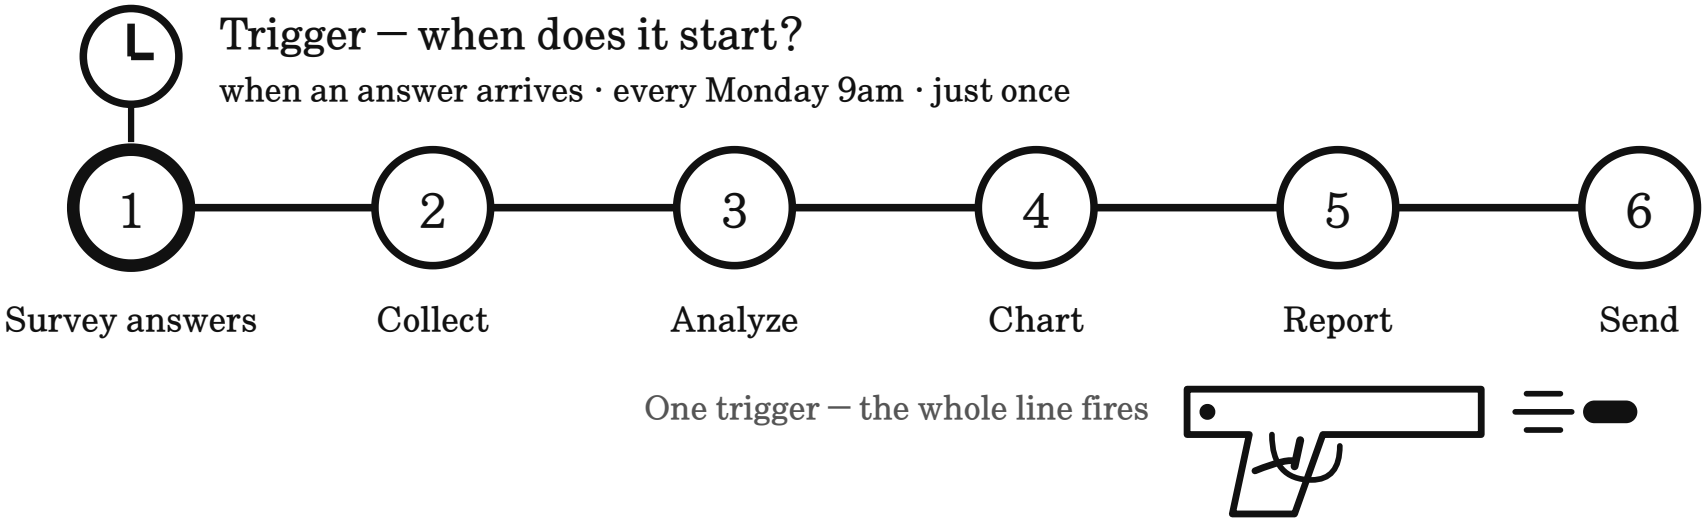

5. Make Draws One Task as Dots — Modules

1. One unit of work = one dot = a module
2. Connect the dots and you have a scenario

One dot is a module. Connect the dots and you get a scenario.

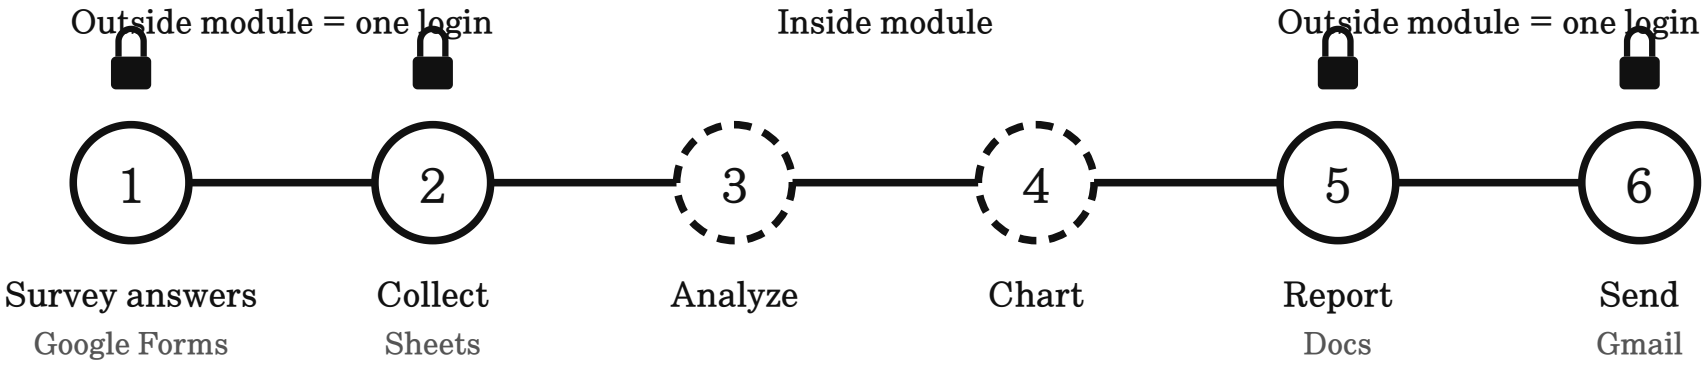

6. Dot Property ① Trigger

1. The first dot on the line — when does it start?
2. When an answer arrives · every Monday at 9 · just once

The first dot decides when it starts.

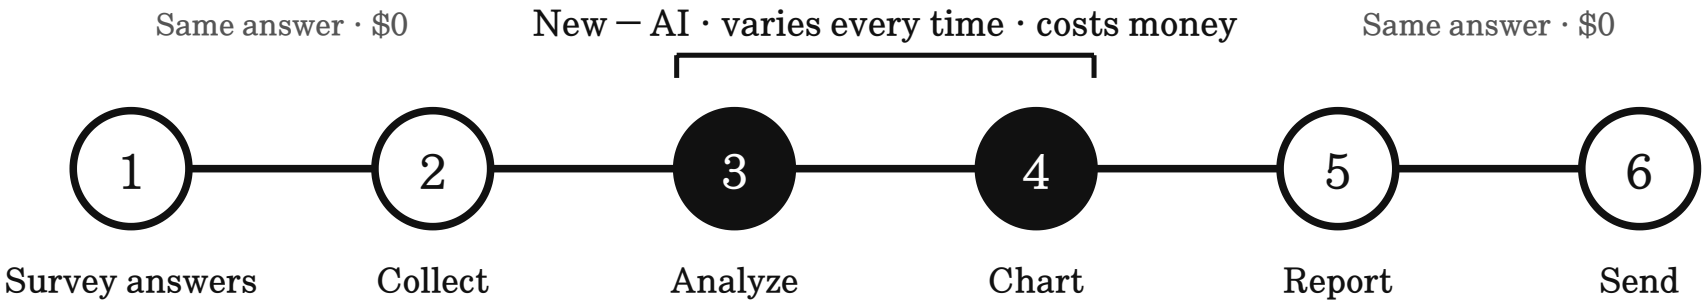

7. Dot Property ② Outside and Inside Modules

1. A dot that uses an outside service needs an account
2. Log in with one Gmail account and most of it is set up

An outside dot needs one login, asked only the first time.

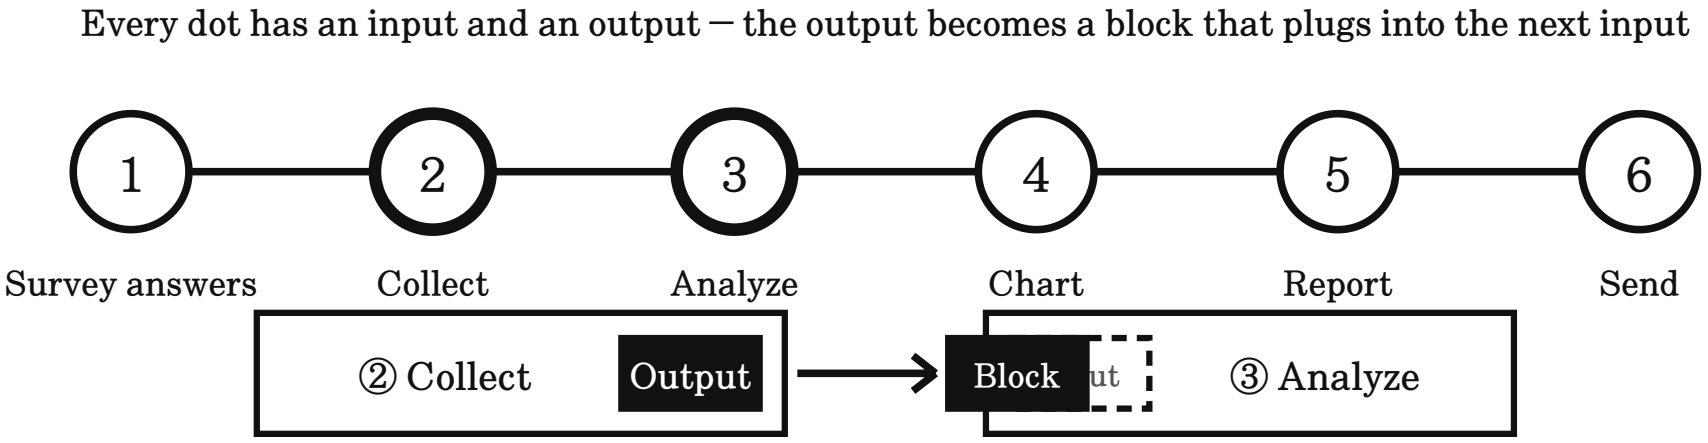

8. A Dot That Didn´t Exist Before — AI

1. Other dots: same answer · $0
2. AI dot: different every time · costs money

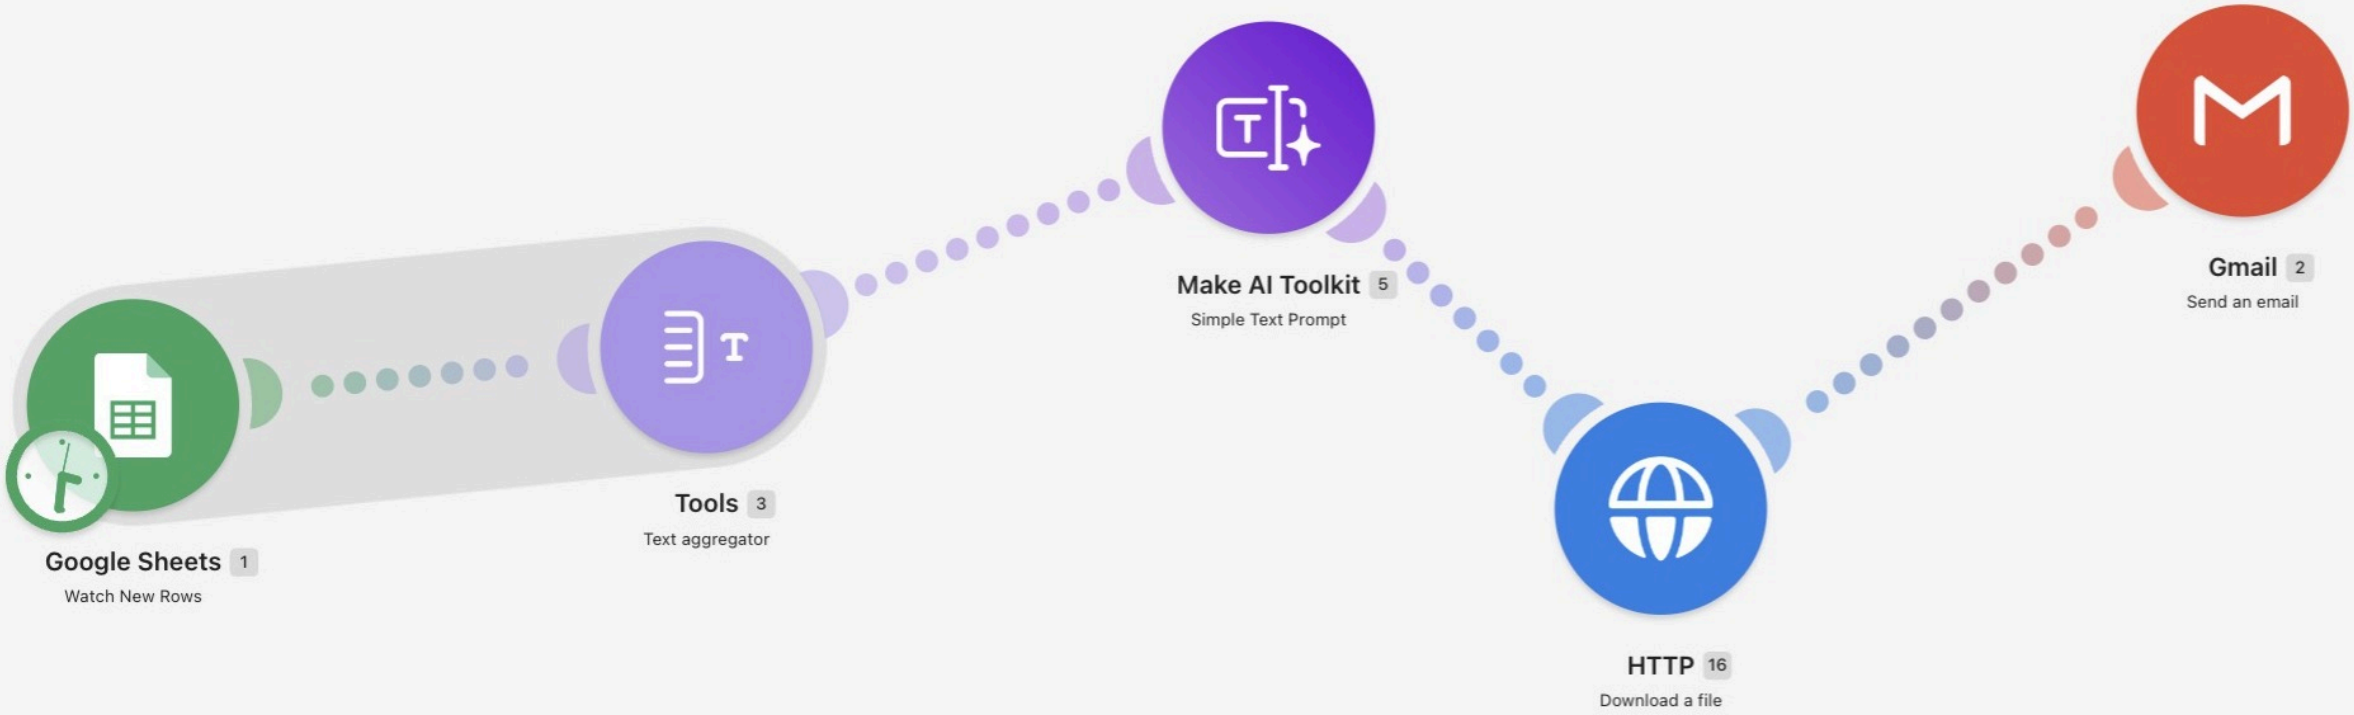

AI costs money. Where you put it matters.

9. Dot Property ③ Input and Output

1. Every dot has an input and an output
2. Drag the previous output in as a block

You bring it over as a block. That's how dots connect.

This is the Make screen. Five dots, one line.

12. Demo ① The Survey

	A	B	C
	Form_Responses		
1	Timestamp	Have you tried to box or punch at home?"	What did you use?
2	9/16/2026 13:35:40	yes	punching bag, wife
3	10/14/2026 1:29:56	yes	punching bag
4	10/14/2026 12:33:58	yes	wife
5	9/16/2026 13:35:40	yes	punching bag, wife
6	9/16/2026 13:35:40	yes	punching bag, wife
7	9/16/2026 13:35:40	yes	punching bag, wife
8			

1. One survey in Google Forms
2. Answers pile up in the sheet

Create a survey .

13. Demo ② Receiving Dot

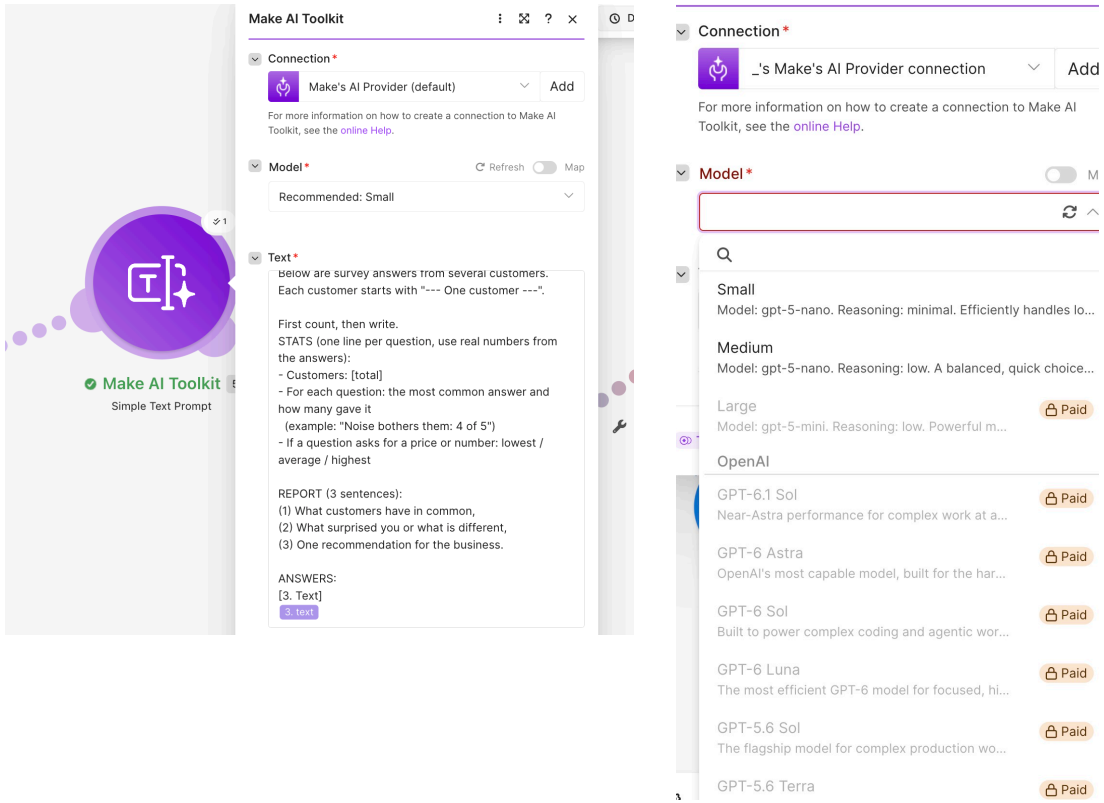

1. Which sheet, which tab
2. How many rows at a time — 10

Just choose where and how many rows .

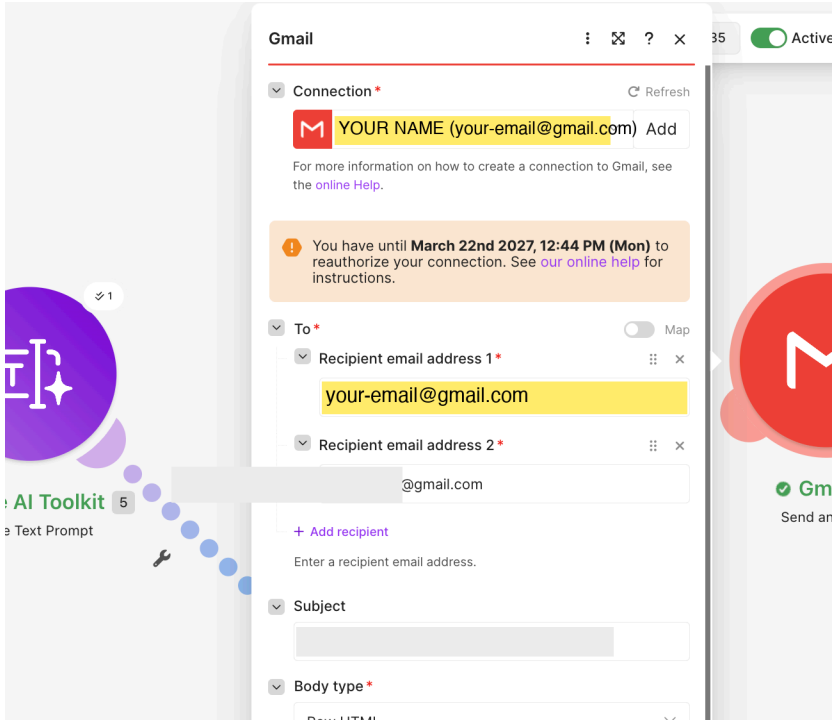

14. Demo ③ The AI Dot

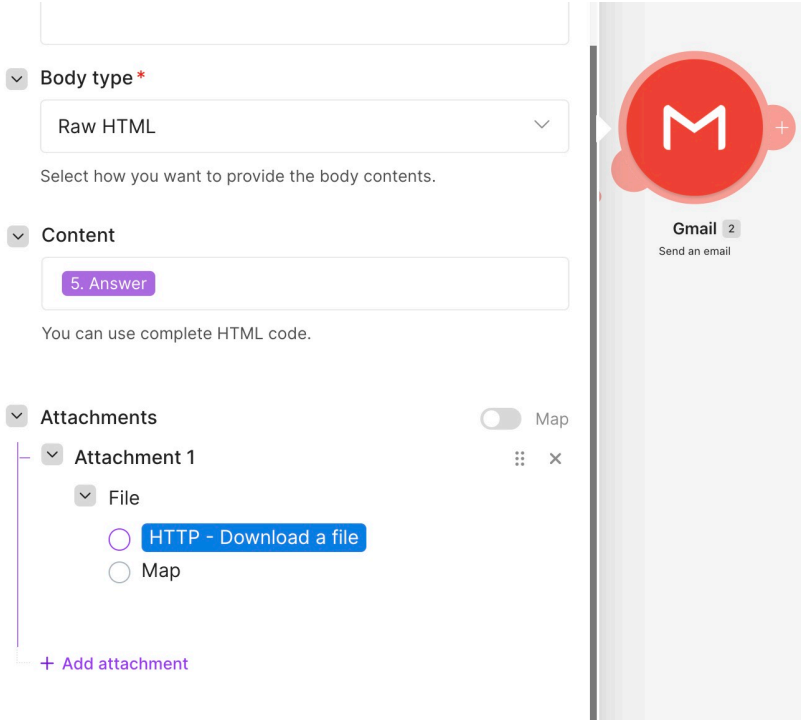

1. Tell it in words — count, group, write 3 lines
2. Pick a model — answers vary a bit

Instruct it in plain words .

15. Demo ④ The Sending Dot

1. Recipient · subject · body
2. The chart goes in as an attachment

Just set recipient and subject .

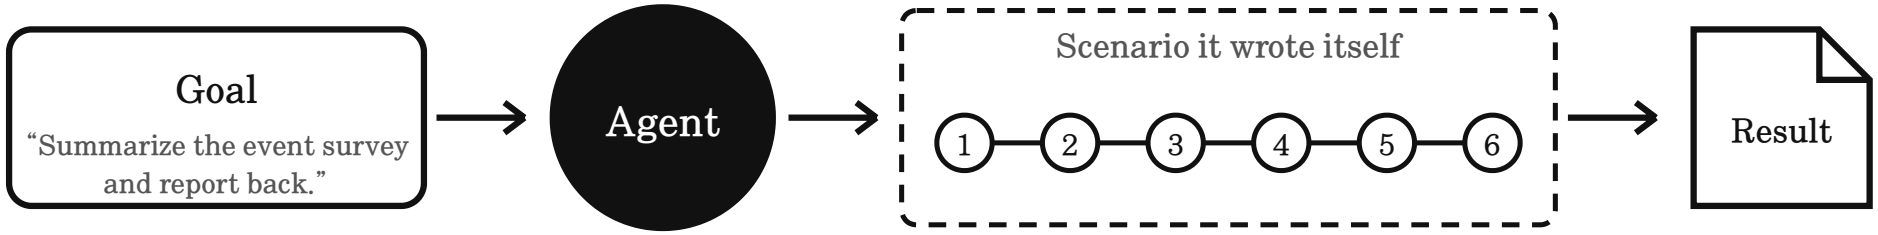

16. Demo ⑤ The Result

1. One email: report + chart
2. Human hand: one click on “Run once”

Run once — and the email arrived.

17. Agents — Give a Goal, Get a Scenario

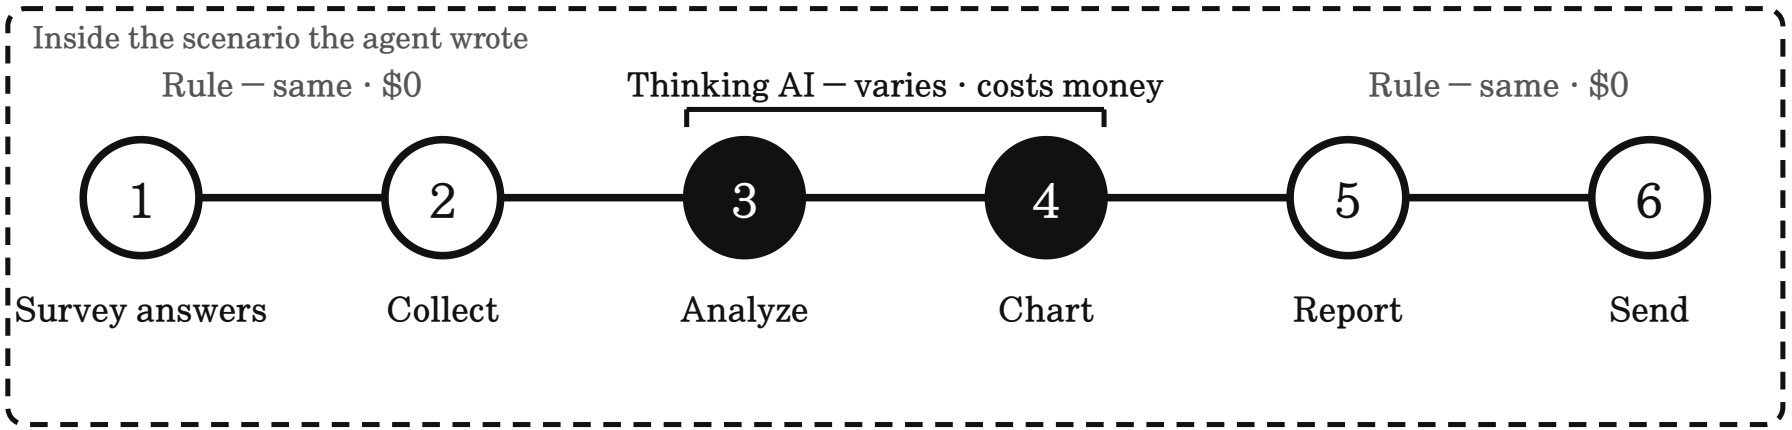

Humans give only the goal — the agent writes the scenario, runs it, and brings back the result

1. A human gives one goal — "Summarize the survey for me"
2. The agent writes, runs, and returns the result

The agent connects the dots. You give the goal.

18. Inside That Scenario

1. Rule dots — same answer every time · $0
2. Thinking AI dots — different every time · costs money

Only two kinds: rules and thinking AI.

19. The Problem — A Black Box

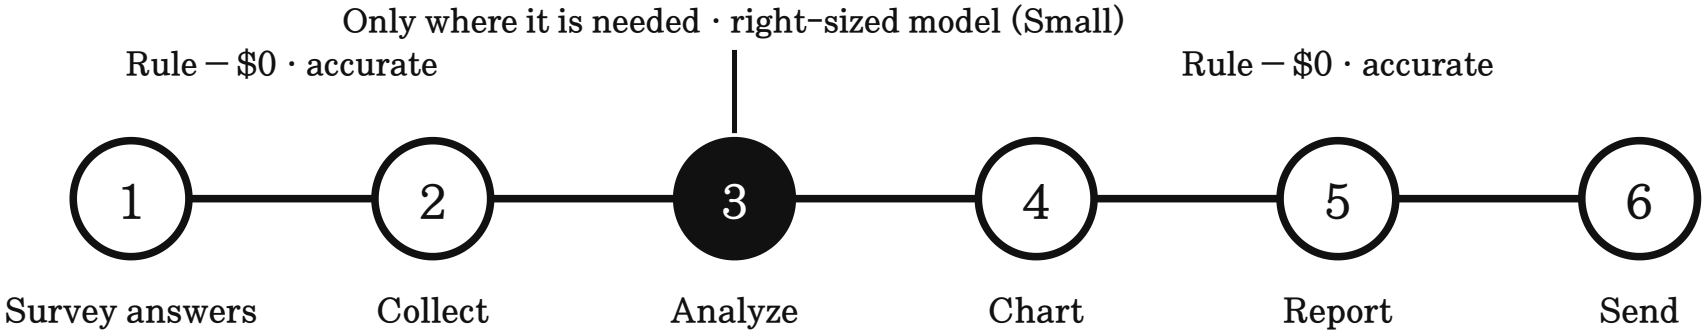

Can´t see inside — where it went wrong · where the money goes · whether it will repeat

1. You can´t see where it went wrong or where the money goes
2. Vibe coding has the same problem

Can't see inside? Can't fix or trust it.

20. The Best Automation

If it works without AI, that is best — AI only where needed, with the right model

1. If rules can do it, use rules — $0, accurate
2. AI only where needed, right-sized model

No AI needed? Best. Otherwise, a right-sized model.

21. A Question to Think About

Build the rule?

Or break the rule?

Now we take the Make dots to your own business

Every step gets one mark: ○ rule, or ★ AI. Then we push ★ down to zero.

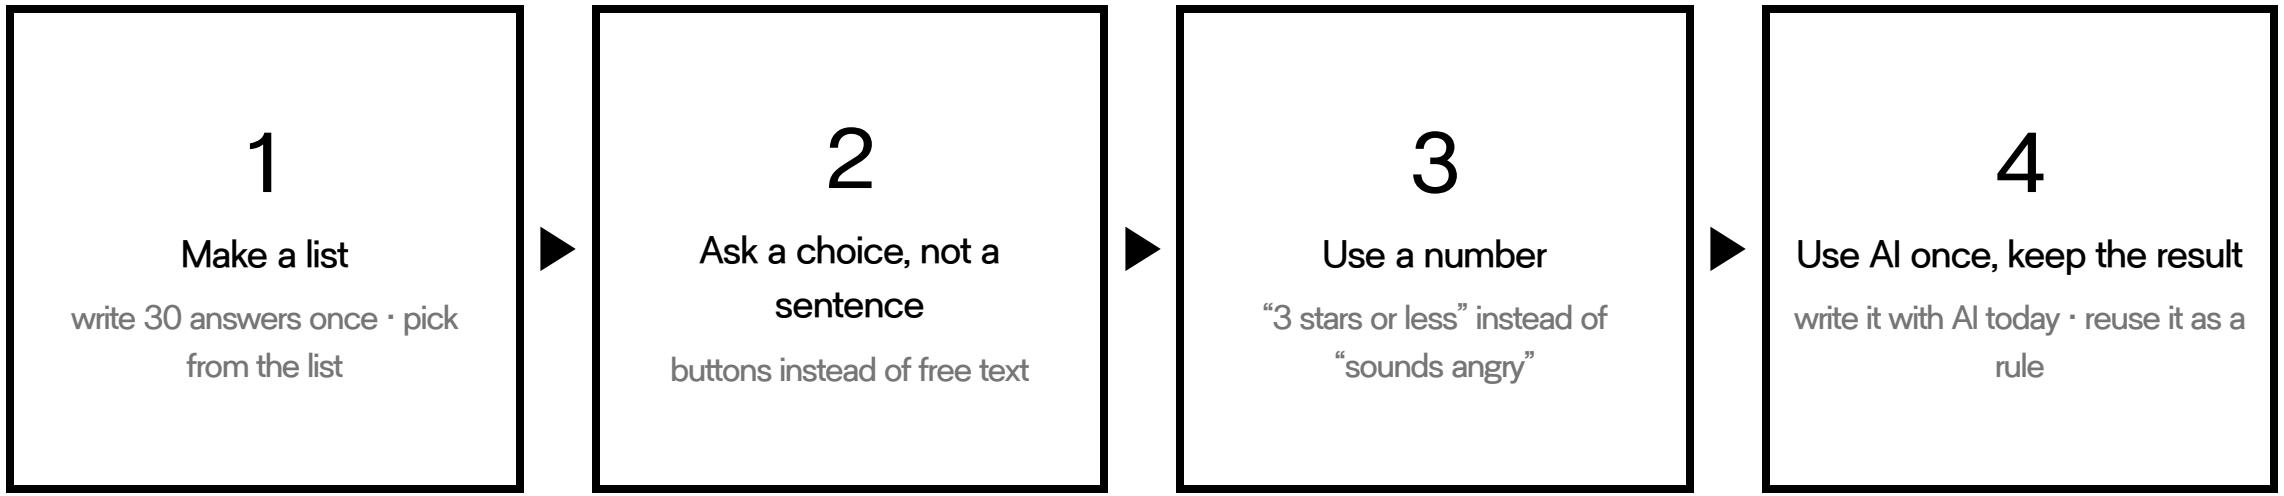

Same dot on the screen. Very different bill.

○ RULE	★ AI
Same input → same output, every time. If / then · a list · a timer · a date · a lookup table. **Cost: $0 · always right · you can see inside**	Reads, judges, or writes something new each time. **Cost: every call · sometimes wrong · a black box**

○ or ★?

○
Send a thank-you email after a booking
same mail every time
○
Pick today's message from a list of 30
the date picks it
★
Read a customer's angry review and reply
needs judgement
○
Add 1 coin after 10 orders
a counter

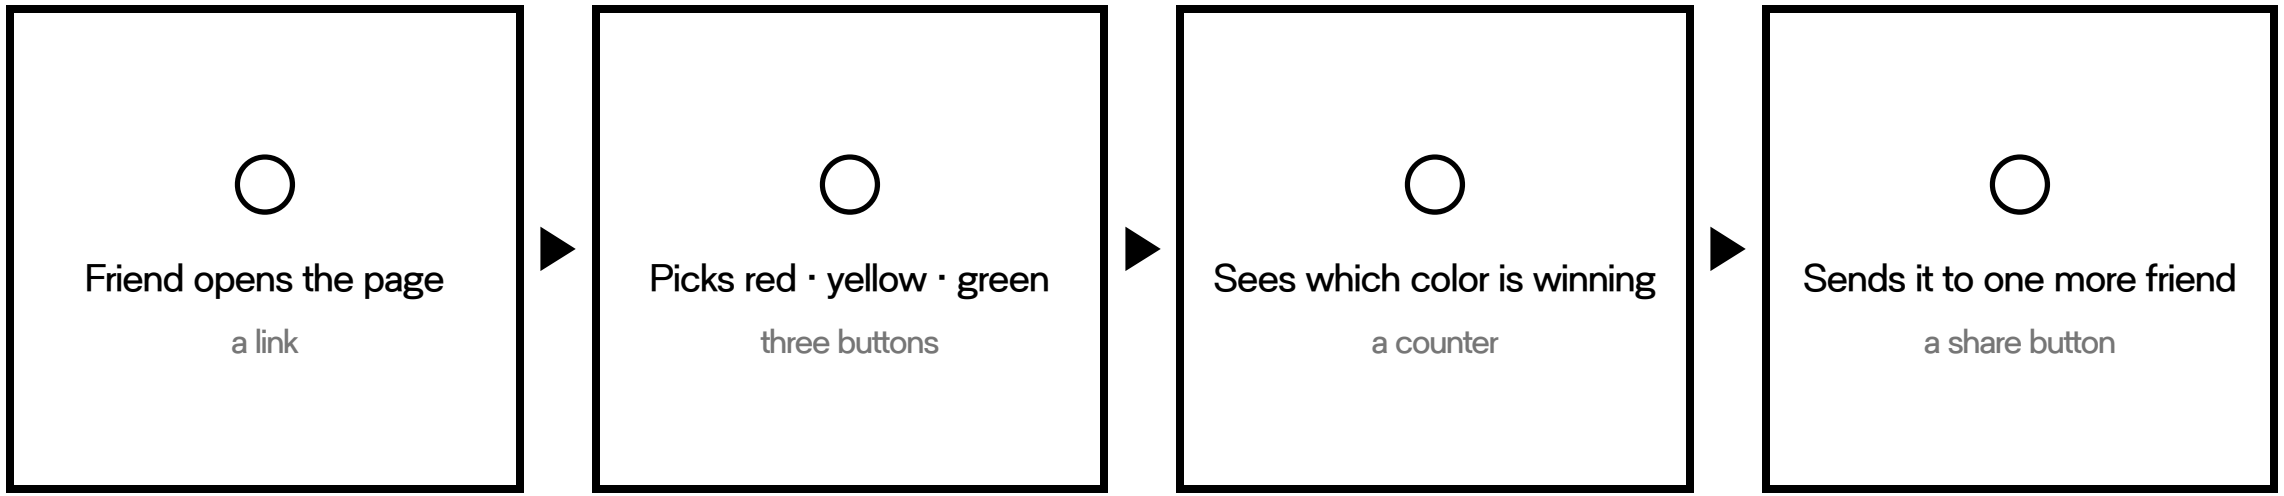

Four ways to turn an AI step into a rule

Keep it small, cheap, and checked

1	S	O
place only — the step that really needs thinking	a small model is enough for most jobs	a rule checks the AI's answer before it goes out

An idea from our class, as steps

★ = 0. It costs nothing to run.

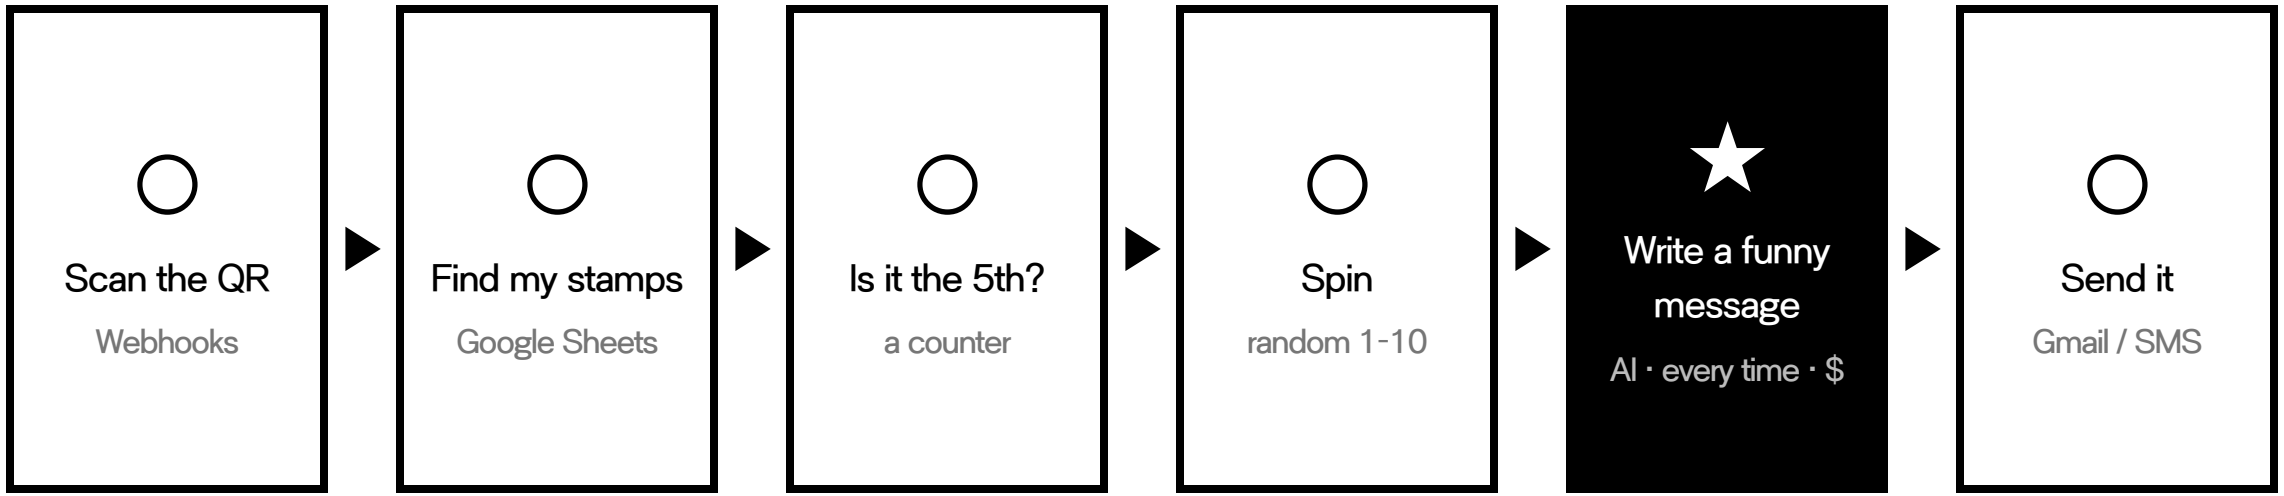

Everyone knows the stamp card. One twist.

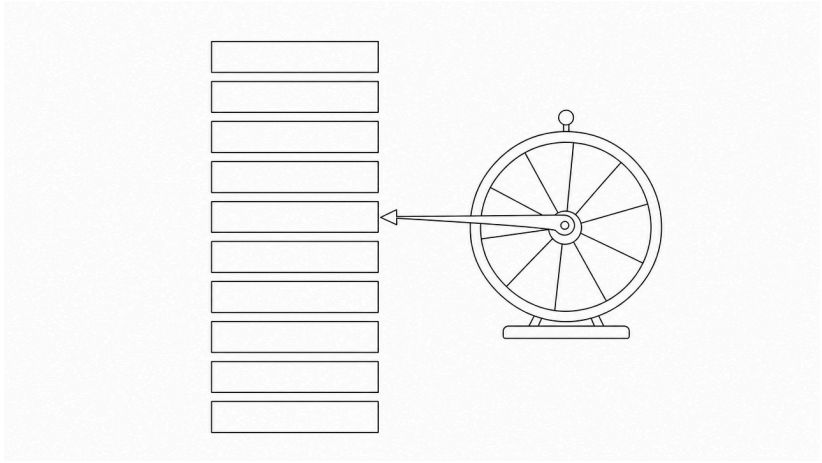

The rule everyone knows — 5 stamps = 1 free coffee.

The twist — the 5th stamp spins a roulette: a free cake, a free coffee, or the barista does a silly dance.

Six dots. Mark each one.

Write 10 messages once. Let the roulette pick one.

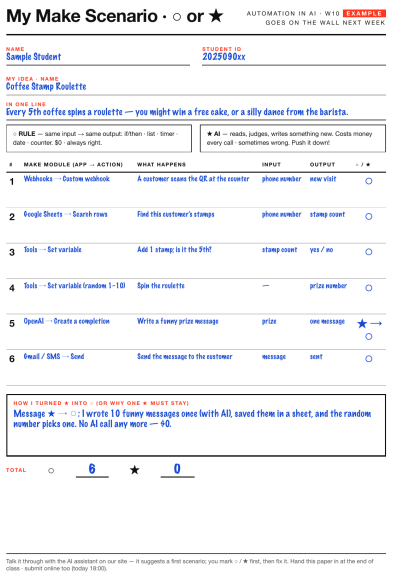

Before — AI writes a new message for every customer. ★ · **costs every call.**

After — use AI **once** to write 10 messages, keep them in a sheet, the roulette picks one. ○ · **$0.**

6 ○

0 ★ — free to run

This is what you hand in — one A4 page

My Make Scenario · ○ or ★

AUTOMATION IN AI · W10 EXAMPLE
GOES ON THE WALL NEXT WEEK

NAME: Sample Student
STUDENT ID: 2025080xx

MY IDEA · NAME: Coffee Stamp Roulette

IN ONE LINE: Every 5th coffee spins a roulette — you might win a free cake, or a silly dance from the barista.

○ RULE — same input → same output: if/then · list · timer · data · counter. $0 · always right.

★ AI — reads, judges, writes something new. Costs money every call · sometimes wrong. Push it down!

#	MAKE MODULE (APP → ACTION)	WHAT HAPPENS	INPUT	OUTPUT	○ / ★
1	Webhooks → Custom webhook	A customer scans the QR at the counter	phone number	new visit	○
2	Google Sheets → Search rows	Find this customer's stamps	phone number	stamp count	○
3	Tools → Set variable	Add 1 stamp; is it the 5th?	stamp count	yes / no	○
4	Tools → Set variable (random 1–10)	Spin the roulette	—	prize number	○
5	OpenAI → Create a completion	Write a funny prize message	prize	one message	★ → ○
6	Gmail / SMS → Send	Send the message to the customer	message	sent	○

HOW I TURNED ★ INTO ○ (OR WHY ONE ★ MUST STAY)
Message ★ → ○: I wrote 10 funny messages once (with AI), saved them in a sheet, and the random number picks one. No AI call any more — 60.

TOTAL ○ 6 ★ 0

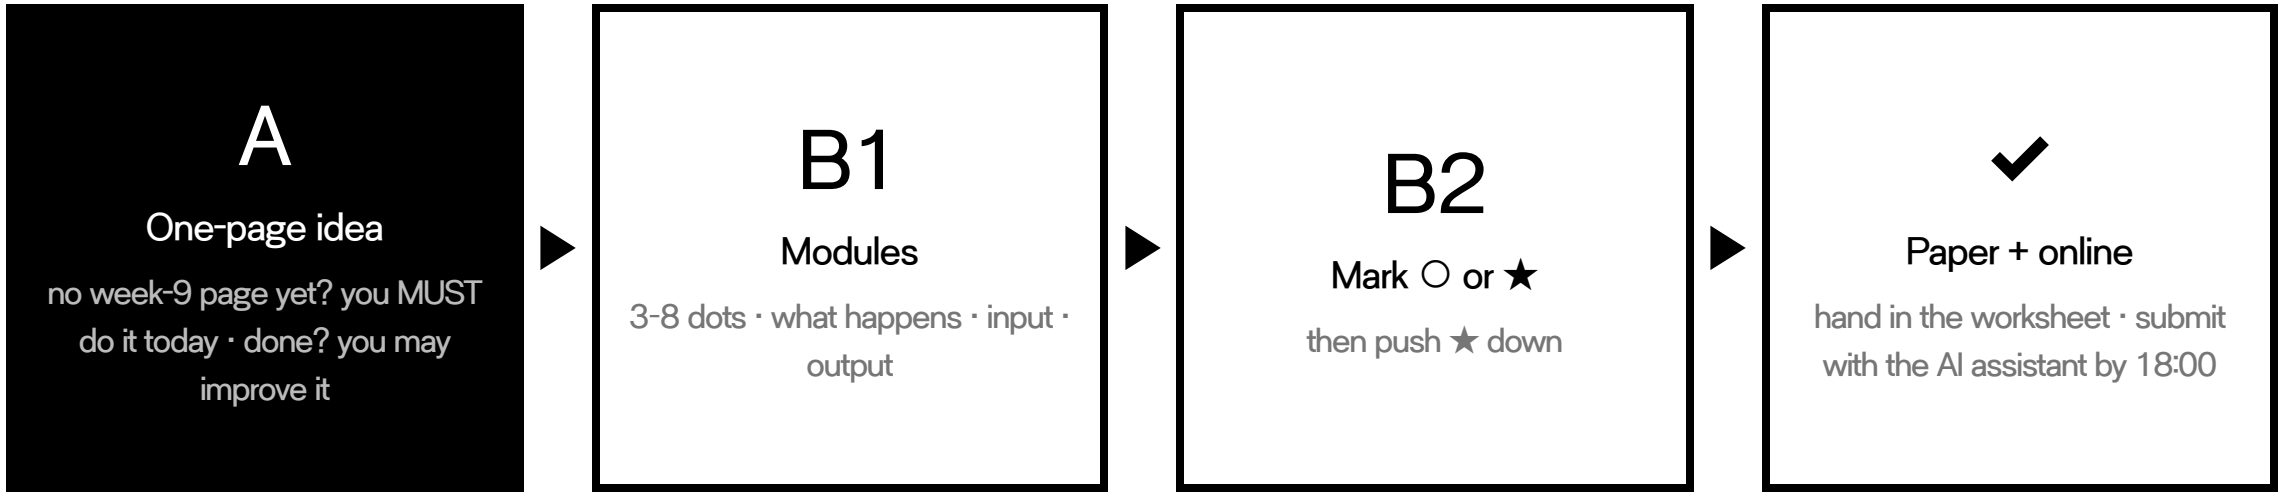

Talk it through with the AI assistant on our site — it suggests a first scenario; you mark ○ / ★ first, then fix it. Hand this paper in at the end of class · submit online too (today 18:00).

Top — your name, idea name, one line

Middle — one row per Make module: app → action · what happens · input · output · ○ or ★

Bottom — how you turned ★ into ○, and the total

(A) your one-page idea · (B) your Make scenario plan

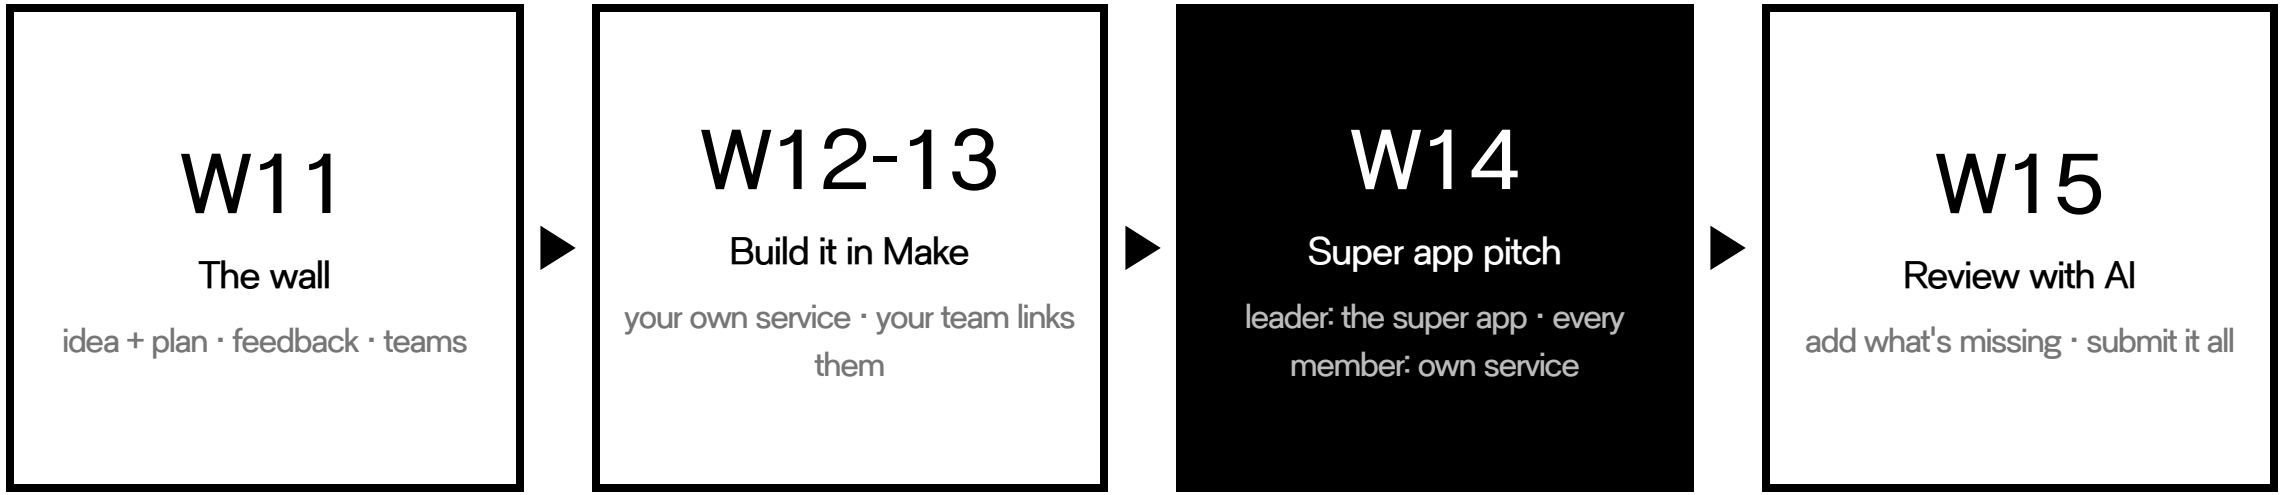

Both parts will be printed and shown

Your classmates will read them, give feedback, and form teams there. Take care.

Your own service first. Then one super app together.

Teams have no size limit — but every service must connect in a meaningful way.

The wall — feedback and teams

Walk, read, scan the QR: “I like this idea because…” — give at least 5

Find people whose services fit yours — teams have no size limit

Bring your best one-page idea and Make plan. Today, 18:00.
