

Before you automate, you ask

Today you find out if your idea is real.

E401, then the PC Lab · Prof. DY Kwon · IGS e-Business

Three things, and that is all

One — sign into the Google account you will keep using

Two — design a survey about your business

Three — build it as a Google Form, and test it

I will show you one thing in Make — you watch, you do not click.

Make starts for you next week, with the same Google account.

In Make, every circle on the screen is a point

A point that watches. A point that acts. A point that decides.
Connect two points, and you have automation.

Today is the day you make your first point.

Steve Jobs, Stanford, 2005

"You can't connect the dots looking forward. You can only connect them looking backward."

Scan to watch — Stanford Commencement Address, 2005

I have been drawing points for a long time

"go to next," 2015

A two-person exhibition with my brother. Gold points on a dark canvas, like a constellation.

Points, drawn by hand — and the plan behind them

The finished canvases, and the original sketch — points arranged into a shape before a single one was painted.

This work has never stopped

"go to next" became an installation in 2018. It is part of the book I am writing now — **dreams become points, and points connect.**

Automation is the same idea, with a different tool. Today, you draw your first point.

An automation with nothing to watch is a machine with no fuel

Next week Make watches a form. **This week you build the form worth watching.**

A form nobody answers teaches Make nothing. So today is not the small week — it is the week underneath everything after it.

Real people, not your own guess

Fifteen weeks of automation are only worth it if what you feed it is real.

Ask what people did, not what they would do

"Would you use this?" — everyone is polite. Everyone says yes.

"Have you faced this problem before?" — now they have to remember something real.

Past behavior is honest. Future opinion is polite. Ask about the past.

Every good early survey covers the same five things

1

Problem

have they faced this situation?

2

Current fix

how do they solve it now — do they already pay for something?

3

Size

how often, and how much does it bother them (1–5)?

The last two

4

Price

if this were solved for them, what would they pay a month?

5

Who

one or two lines about who is answering

Talk these five through with the AI assistant before you open the form. Design first, build second.

Watch — this is what a point looks like

I search for Google Forms. I drag one module onto the canvas.

Nothing else — no connection, no run.

That circle is a point. Next week, you connect it to another one. Now — let's build the real thing it points to.

forms.google.com — sign in with the account you are keeping

A title, two or three lines on what your business is, then 4–5 questions

People stop answering around question six. **Short gets answered. Long gets ignored.**

Mix one rating question (1–5) with one open-text question — numbers are fast to read, sentences tell you why.

One click makes your answers automatic already

Responses tab → the green sheet icon → Create a new spreadsheet

From this second, every answer lands in a row by itself. **Google already automated this — before Make ever touches it.**

Fill in your own form. Watch the row appear.

You are not testing the form. **You are watching automation happen for the first time**, with your own hands, on your own idea.

This feeling — signal in, result out — is the whole course.

Your point becomes a module

W3

You draw one point
the form, today

W4

Make watches it
your point becomes a module

No new work next week — just a new tool pointed at the point you already made, with the same Google account.

Starting next week, the whole school can see this

Your name. Your character. **One sentence about your business.**

A QR code to your form.

Not just this class — **the whole school, scanning a code.**

Write that one sentence like a stranger will read it. Because they will.

The sentence that introduces your business

Say what it is, and who it is for — in one confident sentence

Not "an app for helping people." Say the thing. "A form that finds out if my snack business is worth starting."

This line goes on the gallery page next to your face. **Make it true, and make it yours.**

Talk to the AI assistant. Give it four things.

1

Your Google account
the one you are keeping

2

Your form link
the survey itself

3

Your sheet link
where answers land

4

Your one-line pitch
what goes on the gallery

Nothing is recorded until you press Submit.

Almost everyone gets stuck at the same place

The wrong Google account — check the top-right corner before you build

The professor cannot open your sheet? Share → Anyone with the link → Viewer. Ask 3 people around you first. Then raise your hand.

Share your form right now

KakaoTalk, friends, family — before next week

Ten real answers today is worth more than fifty you write yourself. **Next week Make starts working on them for you.**

— SEE YOU NEXT WEDNESDAY

Bring a form people have actually answered

KakaoTalk group — any time this week.
