

Automation in AI

AI-based Business Process Automation

Wednesday 12:00–14:50 · E401

Prof. DY Kwon · IGS e-Business

Week 1 — first meeting

No homework. No login. Just listen.

Today: what automation is, and how this course runs.

Not today: accounts, submission, computer work.

Next week, everyone gets an account and we start building.

Today, sit back — this is the map for the whole semester.

DY Kwon — professor, and builder

I teach here in the **AI Startup** program, and outside school I build things under the name **DYKWON**: apps, websites, automated systems.

This slide, this handout — made with the same kind of automation you will learn here. Not a coincidence.

I don't only teach automation. I use it every day.

Mountains — where my ideas come from

Hiking and bouldering. My best ideas arrive **there**, not at my desk.

Cappuccino — every morning, not negotiable

Now — the serious part.

What I studied — architecture, then computers

1999	Ajou University	B.S. Architecture
2003	University of Washington	M.S. — ArchiDNA , generative AI
2008	ETH Zurich	Ph.D. — blue-c , spatial computing + gesture

I started by designing **buildings**. Then I asked: can a computer help *imagine* space? That question moved me into code — and it never stopped.

Zurich — a room that could see you

My Ph.D. project **blue-c**: a room with cameras, where your body became the input. Space and computer, in one place.

What I research — space, made by machines

- **Generative space creation** — systems that design space with you
- **Gesture interface** — your body as the input, not a mouse
- **X-Metaverse · x-performa** — live, improvised exhibition and performance
- **Multi-dimensional space direction** — my main work now

1999 — Grand Prize, Architectural Institute of Korea (**WebCAD**)

2008 — SCI paper, Elsevier *CAD Journal* (**ArchiDNA**)

What "space direction" looks like

An exhibition I directed — projections, sound, and phones,
all running together in one dark room. **This is the work I love most.**

What I teach, and where I am going

I have taught at SMIT since **2009** — AI, architecture, metaverse, interactive media. VR/AR, projection mapping, 3D printing, voxel art.

Right now my interest is Business Creation.

Not only *how to build* — but how a built thing becomes something people pay for. That is why this course ends with a working system, not a finished assignment.

One automation every week — for YOUR work

- **Not** a course about memorizing software menus.
- You pick **your own field** — your shop, your idea, your job search.
- Every week, you automate **one repetitive task** from that field.
- After 15 weeks: a **working system** that keeps running.

Three tracks — all equal

Track	Who	You automate
A. Work I do now	family shop, side job, online selling	that work's repetitive tasks
B. Work I want to do	you have a business idea	the daily tasks of that business
C. My work & study	not decided yet — totally fine	job applications, deadlines, documents

Track C is not lower. About half of every class starts here.

You can change tracks any time.

Every week, same shape

1. **I show you** — live, on this screen.
2. **You build it** — for YOUR field, in the PC Lab.
3. **You submit** — one link or one line, before you leave.
4. Submitting during class = **attendance**. Nothing separate to check.

Next week we move rooms after the first hour — I'll show you where.

Building it now — week by week

The week's task · your submission · your progress ·
an AI assistant when you are stuck.

This week: just look. The address comes next week.

Scan with your phone.

Announcements live here. Class material always lives on the website.

Before computers — imagine hiring someone

You need work done. So you **hire a person** and pay them.

What do you have to do?

- 1. Prepare the work · 2. Give the manual ·
- 3. Check the process · 4. Check the result

Automation is the same job — you just hire a **computer** instead.

Same four steps — person, or machine

Step by step, from zero

1. A computer does what you **tell** it — a command.
2. Old way: to give a command, you had to **write code**.
3. **New way: you "code" with normal words.**
4. Coding is just a **set of commands** — nothing more.

You already know how to give instructions. You do it every day.

You must be able to tell them apart

	Computer automation	AI automation
Rule	fixed, same every time	needs judgment
Example	a calculator: $2+2=4$	reading an email, writing a reply
Needs	just a computer	a computer + an AI engine

Ask yourself: calculation, rules, copying → just a computer.
Reading, writing, deciding → you need AI.

Computer, or AI?

"Send the same reminder email every Monday at 9am."

→ Computer. No judgment needed, just a rule.

"Read 100 customer messages, write a different reply to each."

→ AI. Every message is different — that needs judgment.

Connecting services, so they run by themselves

Automation = connecting different computer services together, so they work without you touching them every time.

Make.com + Notion — both free

- **No coding.** Not even a little.
- You connect boxes on a screen — like connecting pipes.
- Free plans are enough for this whole course.

Next week: everyone makes a free account for both.

Five steps, zero hands

You run a small shop. You send a 10-question survey to 50 customers.

Old way: read every answer by hand, write notes, thank each person — hours.

New way:

Form → Sheet → AI reads it → Email sent → Notion organized

You touched **zero** of those five steps.

Next week — Week 2

Wednesday, same time. Here first, then the PC Lab.

Next week we start for real:

1. You make your **website login** and a free **Make.com** account.
2. You build your **first automation** — with your own field.

Bring with you: your **Google account** (you need it to sign up),
and **one repetitive task** you want to stop doing by hand.

Think about that one task this week. That is the only preparation.

Questions?

Ask now — or in the KakaoTalk group any time this week.
