

Your class website, and your business

Wednesday 12:00–14:50 · Lecture: E401 · Practice: PC Labs · Prof. DY Kwon

Today you do two things. Sign in to the class website. Answer three questions about your business.

And you test it. Today the whole class opens this site at once for the first time. Something will break — tell me in the KakaoTalk group and my AI fixes it. That is not a failure of the day; that is the day.

No building today. For Make you only create a free account — we open it properly next week.

Step 1 — Sign in · negalab.github.io/automation-in-ai

The class website

Your **student ID** (9 digits) and the **email the school has for you** — the address you gave at admission, not a new one. The first sign-in locks it to your ID. Wrong email? Raise your hand: ten seconds to unlock. **Submitting during class is your attendance.**

The KakaoTalk group

Announcements live here — and this is where you **tell me what broke**. Say what you clicked and what happened; a screenshot is even better. My AI reads it and fixes it, often the same day.

Step 2 — Submit by talking. Three questions, and what each is for.

1 Introduce yourself

Where you are from, what you study, what you do outside class.

Why: a whole class of you, one professor — this is how I learn who is in the room. **Feeds:** next week you form your own groups, and people find each other through what you write here.

2 What business are you thinking about?

The one that matters most. Every week for fifteen weeks you automate something from it — a form about it in Week 3, emails that answer themselves in Week 5, a working system in Week 15.

Three ways to answer. **A** work I do now — family shop, side job, online selling. **B** work I want to do — an idea you have been thinking about. **C** my work & study — job applications, deadlines, documents. **C is not lower:** about half of every class starts there, and a visa deadline is a real repetitive task. You can change any time — but you need one today.

3 Which part would you automate?

One thing you do again and again by hand. Say why it is slow or boring.

Why: automation only works on repetitive work — if it happens once, there is nothing to automate. **Feeds:** this becomes the first thing you build, so pick the easiest one. **Good:** "copying orders into a sheet, every day." **Not yet:** "grow my business." If you cannot say when it happens and what you do with your hands, it is not ready.

Write in your own language — Nepali, Uzbek, Vietnamese, Urdu, Korean. The assistant answers in the same language and submits in your language and in English. Do not lose your meaning to your English. Nothing is recorded until you press Submit.

Step 3 — Make. Go to **make.com** → Get started free → sign up with Google. No Google account? Your email works the same. Nothing to build in it today. · **Stuck?** Ask three people around you first. Cannot sign in? Raise your hand. Or ask the AI assistant on the site. · **What gets recorded:** your submissions, their time, and your chats with the AI. The professor reads them to improve the class — nobody else sees them, never other students. Do not type passwords or bank details anywhere on the site.
