

Your own key

**Last week you borrowed an AI. Today you plug in your own —
Gemini, with your own key.**

E401, then the PC Lab · Prof. DY Kwon · IGS e-Business

Short talk. Long practice.

One — why your own key is different from last week's AI

Two — the three steps that plug ANY outside service into Make

Three — swap last week's AI for Gemini, and run it

Week 6 changes one point inside it. Build Week 5 first.

Today we do not build a new scenario. We open **last week's** and swap one point. If it is not there, there is nothing to swap — and the assistant will send you back to Week 5 before it starts Week 6 with you.

Open the Week 5 page now. Put your hand up and someone who finished will sit with you.

Join us the moment it runs. Late still counts as attended.

Today it becomes yours

Week 5 — borrowed

Make's AI. No key, no account.

Make chose the models — **Gemini was not in the list.**

Every word it read cost **Make credits.**

Week 6 — your own

Google's Gemini, with **your** key.

You choose the model.

Google counts the words — on the **free tier.**

Same scenario. Same four points. One point changes owner.

Every outside service joins Make the same way

1

KEY

made on the service's own site

2

CONNECTION

paste it into Make — once

3

MODULE

pick an action, drop in blocks

Gemini today. Next week, many more — and every one of them is these three steps.

A password for a machine

A key is a long line of letters that tells Google: "**this request comes from me.**" Make shows it to Google every time your scenario runs.

Anyone who has your key can...	So...
use your account, as you	never paste it into KakaoTalk , the class assistant , a screenshot , an email
use up your free limit	if it leaks, delete it and make a new one — it takes 30 seconds

You paste it in exactly one place: Make's connection box.

At Google AI Studio

1

aistudio.google.com

sign in with your Google account

2

Get API key

left menu

3

Create API key

let it make a project

4

Copy

then close the tab

School account says "not available"? Use your personal Gmail. You must be 18 or over.

Right-click the line, as always

Same module name as last week — but under the Google Gemini AI app, with the Gemini star. You connect once; every Gemini point after this uses the same connection.

No permission window this time. That is why it works on a phone too.

This time Gemini is in the list — because it is your key

Flash

take this one — fast, free tier

Flash-Lite

faster, simpler answers

Pro

slower, smaller free limit

Pick one with Flash in its name. Not Image — image models have no free tier
(ai.google.dev/gemini-api/docs/pricing, checked 2026-10-01).

The prompt box — instruction first, one block last

Open your **old AI point** → select the whole prompt → **copy**. Open the **Gemini** point → paste it into its prompt box.

You are helping a student understand their small business.

... under 150 words ... do not invent anything ...

Put `<br>` at the end of every line of your answer.

ANSWERS:

[click the block named Text, from the gathering point]

If the last line shows letters instead of a green block — delete it and click the block again.

Gmail's Content takes Gemini's block now

1. Open **Gmail** → click in **Content**
2. **Delete** last week's AI block
3. In the panel find the group **Google Gemini AI** → click its answer block
4. Subject: **W6 · your name · My Gemini report** · keep smit.ai.lab@gmail.com in To

The box where the borrowed AI's block used to go. Now your Gemini's block goes there.

Four points again — with Gemini in third place

Right-click the old AI point → Delete module. If the line breaks, drag from the right edge of the gathering point to Gemini.

Five points means the borrowed AI still runs — and still spends your Make credits.

And read what comes

Right-click **Sheets** → **Choose where to start** → **All** → Save. Then press **Run once**.

Nothing came? No new row. Fill in your own form once more, then Run once again.

Borrowed last week. Yours today. Same answers — read by an AI you plugged in yourself.

The free tier reads your text

Google's own price page, free tier: **"Used to improve our products — Yes."** Paid tier: No.

ai.google.dev/gemini-api/docs/pricing · checked 2026-10-01

So: survey answers about a business idea, yes. **Names, phone numbers, ID numbers, anything a person told you privately — no.**

Your key, your account, your responsibility.

All five

1. Your scenario has **four** points — Sheets, Gather, **Gemini**, Gmail
2. Gemini's prompt ends with the **Text** block from the gathering point
3. Gmail's Content holds **Gemini's** block — and nothing from last week
4. Subject starts with **W6**, and smit.ai.lab@gmail.com is still in To
5. You pressed **Run once** and the report arrived in your Gmail

No W6 in the subject = not accepted. The server checks my inbox, not your word.

Talk to the AI assistant

First it asks for the Gmail address you connected in Make.

Then three questions:

1. **Paste the report Gemini wrote** for you.
2. **Put it next to last week's report.** What changed — and which one would you trust for your business?
3. **Which other outside service** would you plug into your business next, and what would it do?

Never paste your key into the chat. Write in your own language. Submitting today is your attendance.

The five that will actually happen

What you see	What to do
"API key not valid"	You copied part of it. Copy again from AI Studio, paste, Save
"Quota" or "429"	Too many runs in a minute. Wait one minute, then Run once
No Gemini in the model list	You opened last week's app. Search Gemini → Google Gemini AI
The report arrives as one long line	The <code>
</code> sentence is missing from your prompt
Run once sends nothing	No new row. Fill in your form once more

Write down the exact words on screen. Ask three people. Then raise your hand.

What you have now

Your form asks. Your sheet collects. A point gathers. **Your own Gemini** reads. Your inbox receives.

You made a key, connected a service, and used it. That is how everything outside Make comes in.

Finished early? Switch the model to Flash-Lite and run again — or ask Gemini to write the report in your own language.

Next week: what else can plug in — and you plan your own automation.
