

Automate yourself

Today Make starts working for you — and you go inside it.

E401, then the PC Lab · Prof. DY Kwon · IGS e-Business

I know what to do. I often don't do it.

I plan it. I even write it down. Then I don't do it. So instead of trusting myself, I set up a machine that moves me.

Today's automation is not for hard workers. It is for the me who doesn't move.

Automate only the work, and something goes empty

AI runs on my thinking. If I stop thinking, AI has nothing to do.

And my thinking does not come at a desk. It comes when I exercise, when I go somewhere new, when I talk with a good friend.

So that time has to go inside the automation too.

Three things, and that is all

One — open Make with the same Google account as last week

Two — connect your sheet to your Gmail: one summary, once a day

Three — add a last line to that email that is only yours

There is no AI inside today's scenario. That is on purpose.

Everyone has one

Mine is the morning. My head is clear. Then the small jobs arrive — emails, forms, checking. I finish them all, and by lunch my best hour is gone.

Automation is not about working faster. It is about protecting your best hour.

Automation saves you 30 minutes. What goes in?

Most people pick up their phone. Then nothing has changed.

The design is not finished until you decide what goes into the empty time.

Not from the screen

Automation can hand you that time back — if you plan for it.

You go inside the automation

If only the work runs by itself, the thinking behind the work dries up.

So today's email carries two things: your business, and one thing for you.

Your business gets one step better every week

Last week you asked. This week you listen.

Before we build — open your sheet

1. **How many real answers?** Count the rows — not your own test.
2. **One answer that surprised you.** What did someone say that you did not expect?
3. **Anything broken?** The form, the sheet sharing, the Google account.

Today Make reads these rows for you — every day.

Watch me first — two points

One point that reads your sheet. One point that sends you an email. Connected by one line.

Then you build the same thing, on your own sheet.

Your sheet, then your inbox

Last week you drew one point. Today it gets a partner.

The first point — your sheet

1. make.com → **Create a new scenario** → the big +
2. Search **Google Sheets** → **Watch New Rows**
3. **Create a connection** → **Sign in with Google** — the same account as last week
4. Pick your spreadsheet and the sheet **Form Responses 1** · Table contains headers: **Yes**

If Make asks where to start, choose All — so last week's answers come in too.

The second point — an email to you

1. The small + on the right of Sheets → **Gmail** → **Send an email**
2. Connect with **the same Google account**
3. To: **your own address** · Subject: **New answers**
4. Body: click in the box and pick one column from your sheet

Press Run once. Open your Gmail.

Five answers in your sheet? You just got **five emails**.

It works — and it is too much. One email per answer is not a summary.

A point that gathers

Many rows in, one text out. Now it is a summary.

Put the gatherer between them

1. Between Sheets and Gmail, add **Tools** → **Text aggregator**
2. Source module: **Google Sheets** · Row separator: **New row**
3. Text: pick the columns you want to read — one line per answer
4. In Gmail's Body, take out the old column and pick the aggregator's **Text**

Press Run once again. Five answers — one email.

Why not every 15 minutes?

Every time Make wakes up to check, it uses **one credit** — even if nothing is new. The free plan has 1,000 a month.

2,880

checks a month, every 15 minutes — the free plan is gone in about 10 days

30

checks a month, once a day

Same email. One of them is almost free.

Once a day, at a time you choose

1. Schedule (the clock icon) → **Every day** → pick a time
2. **Save**
3. Turn the scenario **ON**

Pick the time you want to read it. Tomorrow at that time, the email comes by itself.

One line under the answers — for you, not your business

One thing for your body, or one person to contact today. "Walk 20 minutes." "Call a friend."

Everyone builds the same scenario. The last line is only yours.

In Gmail's Body, type it under the aggregator's Text.

The first email will look bad. That is normal.

Don't just say "I don't like it." That gets you nowhere. Say exactly what to change:

"Show only two columns — the problem and the price." "Put a line between answers."

Clear direction makes a good result.

Sheets, a gatherer, Gmail — and no AI

It still works, every day. Even if every AI company shut down tonight, this email arrives tomorrow.

Build with AI. Run on rules. Next week, AI goes in only one place — it reads your answers and writes a short report.

Talk to the AI assistant. Give it four things.

1

Your Google account

the same as last week

2

Your email

paste the subject and first lines

Make sent you

3

Your business

one thing the answers made you

change or keep

4

Your last line

what you put in, and why

The assistant reads it back. Say yes, and it is saved.

Almost everyone gets stuck at the same three places

1. **The Google sign-in window does not open** — allow pop-ups for make.com
2. **Make finds no rows** — wrong account (top-right corner), or an empty row in your sheet. Make stops at an empty row.
3. **No email** — look in Spam, and check that you pressed Run once

Write down the exact error message. Ask 3 people around you first. Then raise your hand.

Share your form with 3 more people

KakaoTalk, friends, family — right now

More answers today means a better email tomorrow. **Your summary is only as good as the people who answer.**

What my automation is for

"Even without AI one day, I want to stand on my own. To be happy when I'm alone. To do good work by myself."

That's what my automation should prepare me for, every day.

— SEE YOU NEXT WEDNESDAY

Let the email come every day

KakaoTalk group — any time this week.
