

Values travel

Every point hands something to the next one. Today you do that four times.

E401, then the PC Lab · Prof. DY Kwon · IGS e-Business

Three things, and that is all

One — learn the one move: take a value from the point before, and drop it into your text

Two — add two points: one gathers all the answers, one is an AI that reads them

Three — the AI writes a short report on your business, and mails it to you

Your business gets one step better every week

Last week you got answers. This week something reads them for you.

Week 5 sits on top of it. Build Week 4 first.

There is nothing to add to an empty screen — and the assistant will send you back to Week 4 before it starts Week 5 with you.

Open the Week 4 page now. The handout and the assistant walk you through it. Put your hand up and someone who finished will sit with you.

Join us the moment it runs. Late still counts as attended.

You already do this by hand, every day

You write a letter once, and leave the blanks empty:

Dear _____, thank you for your answer about _____. You said it happens _____ times a week.

Then you open your sheet and fill the blanks in by hand. Every time. For every row.

Today you write the letter once, and the blanks fill themselves.

Every point hands out named values

A point is not just a thing that runs. **It runs, and then it holds a handful of values with names on them.**

Everything after it can reach in and take them.

Click any empty field, and they appear

Click inside **any box** of a later point — Content, Text, a prompt, anything.

A panel opens on the **left**. The values are grouped **by the point that made them**:

The heading tells you where it came from. That is the whole idea.

Type, click, type, click

You are not choosing **either** your words **or** a block. **You mix them.**

What you do	What arrives
Type Problem: → click the block (B) → type 	Problem: it takes too long to order
Type They now use: → click (C) → type 	They now use: a paper notebook

One box. Your words and their values, side by side.

All three happened last week

What you do	What arrives	Why
You type "(B)" with the keyboard	the letters (B)	typing is not clicking. It must come from the panel
You click the top block [bundle]	the whole row, as code	that block is everything at once, not one answer
You press Enter for a new line	everything on one line	the box is Raw HTML. Type <code>
</code> instead

If your email looks wrong, it is almost always one of these three.

Watch where the block comes from each time

	The box you click in	Where the block comes from
1	Gmail → Content (last week — a quick review)	Google Sheets
2	the gathering point → Text	Google Sheets
3	the AI point → prompt	the gathering point
4	Gmail → Content (replace it)	the AI

The move never changes. Only the point you take from.

Two new points, in the middle

You keep last week's scenario. You open it and push two points into the middle.

Ten answers, ten emails

Last week, ten new answers meant **ten separate emails**. Each one ran the whole scenario again.

An AI cannot see a pattern in ten separate runs. It only sees one answer at a time — so it can never tell you "four people said the same thing."

10

emails yesterday, one per answer

1

report today, all answers together

To see a pattern, the answers have to be in one place first.

Push it in between

1. Open **last week's scenario** (Scenarios → click it)
2. **Right-click the line** between Sheets and Gmail → **Add a module**
3. Search **Tools** → choose **Text aggregator**
4. **Source Module:** Google Sheets – Watch New Rows

Source Module means: whose values am I gathering? Answer: the sheet's.

The gathering point's Text box

Click inside the **Text** box. The panel opens on the left — the same blocks as last week.

Build one answer's worth of text, exactly like your email:

Then open **Advanced settings** → **Row separator:** New row .

You write one answer. Make repeats it for every answer, and glues them together.

Many rows in. One value out.

Goes in row 1 · row 2 · row 3 · row 4 ...	Comes out one value, named Text , holding all of them
---	---

That single block is what you will hand to the AI. Remember its name: **Text.**

The names you have heard

	Made by	Known for
ChatGPT	OpenAI	the one that started it — general writing and reasoning
Gemini	Google	built into Google's own tools, and into Make
Claude	Anthropic	long documents, careful writing

Three companies. One job today: read your answers and tell you what they say.

The real difference, today, in this room

To connect it yourself	What it asks for first
ChatGPT	a credit card, and at least \$5 loaded before it will answer once
Gemini	a Google account. Free.
Claude	a small starter credit, then a card. No free tier.

Checked 2026-09-28 · openai.com · ai.google.dev · claude.com

This is why we use Gemini today. Not because it is the best — because you can all use it right now.

Make has the AI already inside

You do **not** make an account. You do **not** copy a key. You do **not** enter a card.

Make has a point called **Simple text prompt**. You add it, you pick a model from a list — and the list has **ChatGPT, Gemini and Claude** in it.

I will run the same question through all three. Then we all pick Gemini.

The same answers, three brains

Watch the screen. One prompt, one set of answers, three models
— and three different reports.

Notice: the **shape** is the same. The **detail**, the **length** and what
each one **notices** are not.

**Choosing a model is a real choice. Today we all choose Gemini, so we are
debugging the same thing.**

Add it after the gathering point

1. Click the **+** on the right of the gathering point
2. Search **Simple text prompt** → choose it
3. **Model:** choose a **Gemini** one from the list
4. Leave everything else as it is

No connection window. No key. No card. If a sign-in window appears, you picked a different module — go back and search again.

Your instruction, plus one block

Click in the **prompt** box. **Type your instruction first**, then click **one** block at the end.

You are helping a student understand their small business.
Below are real answers from a survey. Write a short report, under 150 words:
what people said · what repeats · one thing to change.
Write simply. Do not invent anything that is not in the answers.
Put `<br>` at the end of every line of your answer.

ANSWERS:

[click the block named Text, from the gathering point]

Notice where that block came from. Not the sheet — the point right before.

The AI only knows what you put in the box

Weak

"Summarize this."

It does not know who you are, how long, or what for.

Strong

Who it is helping · how long · what three things to cover · **"do not invent anything"**

Same answers, same model. The instruction is what changes the report.

It takes values in, and it gives one back

There is nothing magic about the AI point. **It is a point.** It holds a value with a name, exactly like the sheet does.

Which means you already know how to use it.

Put the report in the email

1. Open your **Gmail** point → click in **Content**
2. **Delete everything that is in there** from last week
3. In the panel, find the group for your **AI** point
4. Click the block it gives back — the report

Subject: **W5 · your name · My business report**

The box where the sheet's blocks used to go. Now the AI's block goes there.

And read what comes

Right-click **Sheets** → **Choose where to start** → **All** → Save. Then press **Run once**.

Nothing came? No new row since last time. Fill in your own form once more, then Run once again.

Ten answers went in. One report came out. You built that.

The free tier reads your text

Google says it plainly: on the **free** tier, what you send **"is used to improve our products."** On the paid tier it is not.

ai.google.dev/gemini-api/docs/pricing · checked 2026-09-28

So: survey answers about a business idea, yes. **Names, phone numbers, ID numbers, anything a person told you privately — no.**

This is true of every free AI, not only this one. Know it before you use it at work.

All five

1

Your scenario has
four
points, in order

2

The AI's prompt ends
with the block from the
gathering point

3

Gmail's Content holds
the
AI's
block — and nothing
from last week

4

Subject starts with
W5
, and
smit.ai.lab@gmail.com
is still in To

5

You pressed
Run once
and the report arrived
in your Gmail

No W5 in the subject = not accepted. The server checks my inbox, not your word.

Talk to the AI assistant — three questions

1. **Paste the report** the AI wrote for you.
2. **What did it get right, and what did it miss?** You know your answers better than it does.
3. **Because of this report, what is one thing you will change** in your business idea?

Type the Gmail address you connected in Make when it asks — the server checks the inbox right then.

Write in your own language. Submitting today is your attendance.

The four that will actually happen

What you see	What to do
The prompt box shows the letters, not the value	You typed it. Delete it and click the block instead
The AI answers about nothing	Your block went in before your instruction, or no block at all
Run once sends nothing	No new row. Fill in your form once more
The email is empty	Content still holds last week's blocks — delete them, click the AI's block

Write down the exact words on screen. Ask three people. Then raise your hand.

Two things worth doing

Change the instruction and run it again. Ask for three bullet points instead of a paragraph. Ask it to name the one question nobody answered well. Same answers, different report — see how much the instruction does.

Then share your form with three more people. More answers, a better report next week.

What you have now

Your form asks. Your sheet collects. A point gathers. An AI reads.
Your inbox receives.

Five pieces, and you connected every one of them by hand.

Next week: people sign up for your business.
