Automating work with Make

Focusing on satisfaction survey analysis — automation is connecting dots.

E401, then the PC Lab · Prof. DY Kwon · SMIT E-BUSINESS

Scenario — Event Survey

- The event is over. Send a survey to 300 participants.
- Analyze the answers and draw great charts.
- Write the report and share it with your team and manager.

Let's split one task into steps.

- Survey → analyze → chart · report → share
- Proposal feedback · event satisfaction · demand surveys

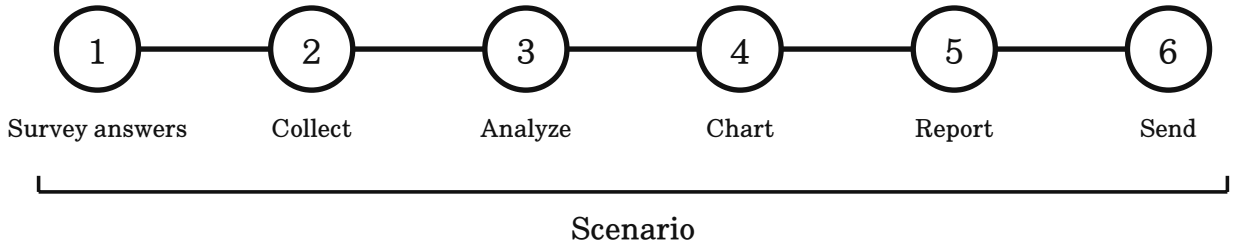

Now let's automate this.

- Survey: Google Forms · results: Sheets
- Report: Google Docs · sending: Gmail

Non-experts automating without coding.

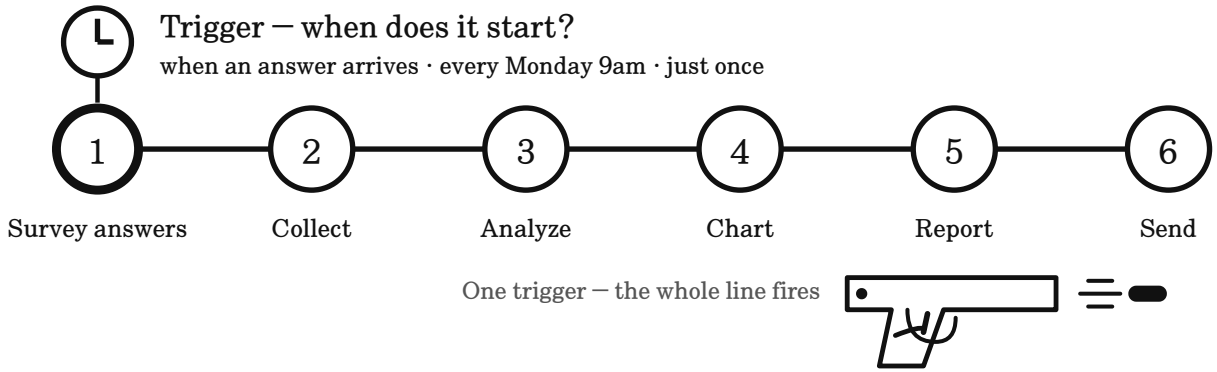

- Many ways to automate · today: Make
- 2016 Czech “Integromat” → 2022 “Make” · 3,000 apps · 1,000 free runs a month

One dot is a module. Connect the dots and you get a scenario.

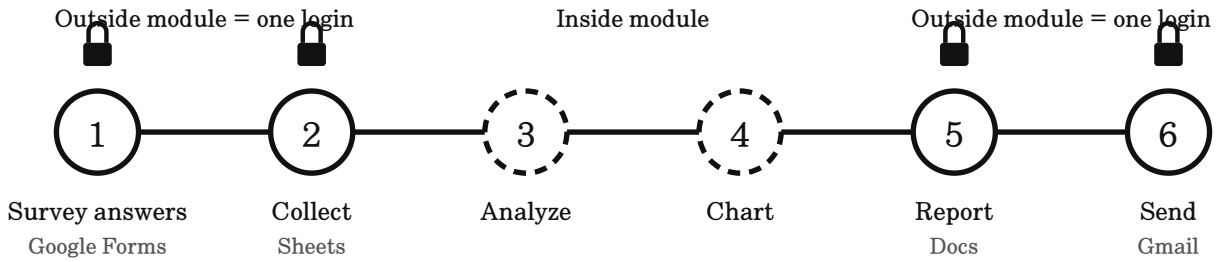

- One unit of work = one dot = a module
- Connect the dots and you have a scenario

The first dot decides when it starts.

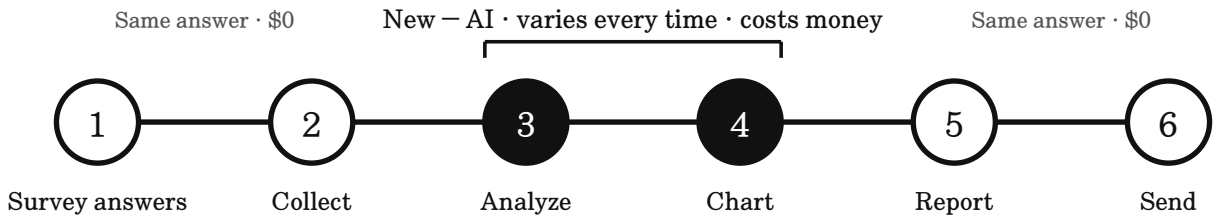

- The first dot on the line — when does it start?
- When an answer arrives · every Monday at 9 · just once

An outside dot needs one login, asked only the first time.

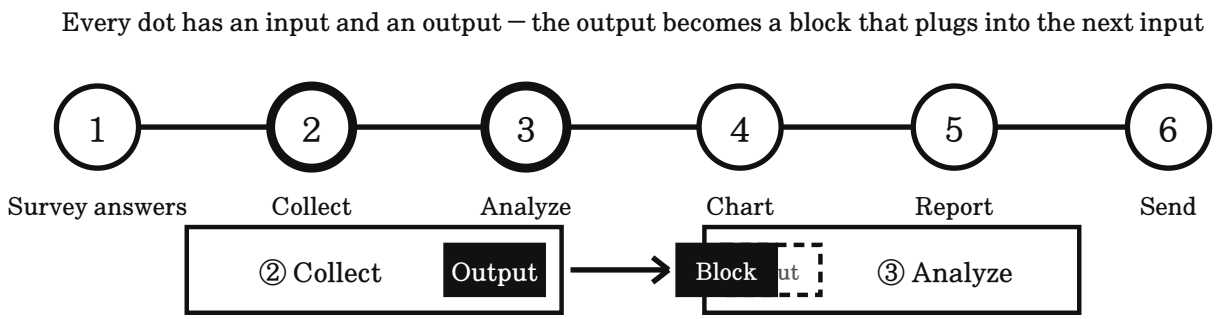

- A dot that uses an outside service needs an account
- Log in with one Gmail account and most of it is set up

AI costs money. Where you put it matters.

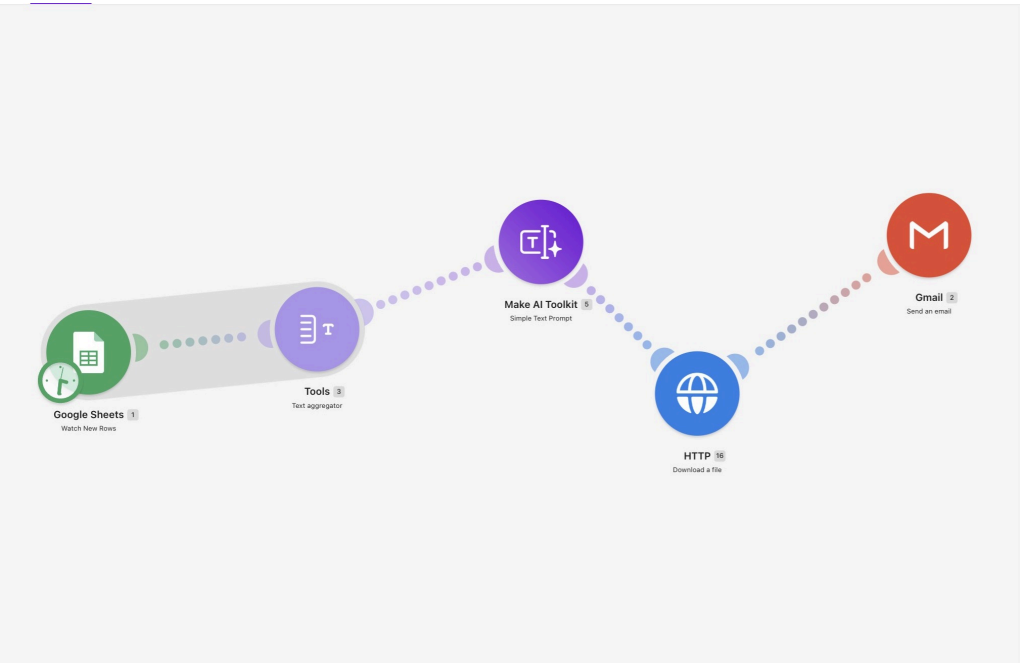

- Other dots: same answer · $0
- AI dot: different every time · costs money

You bring it over as a block. That's how dots connect.

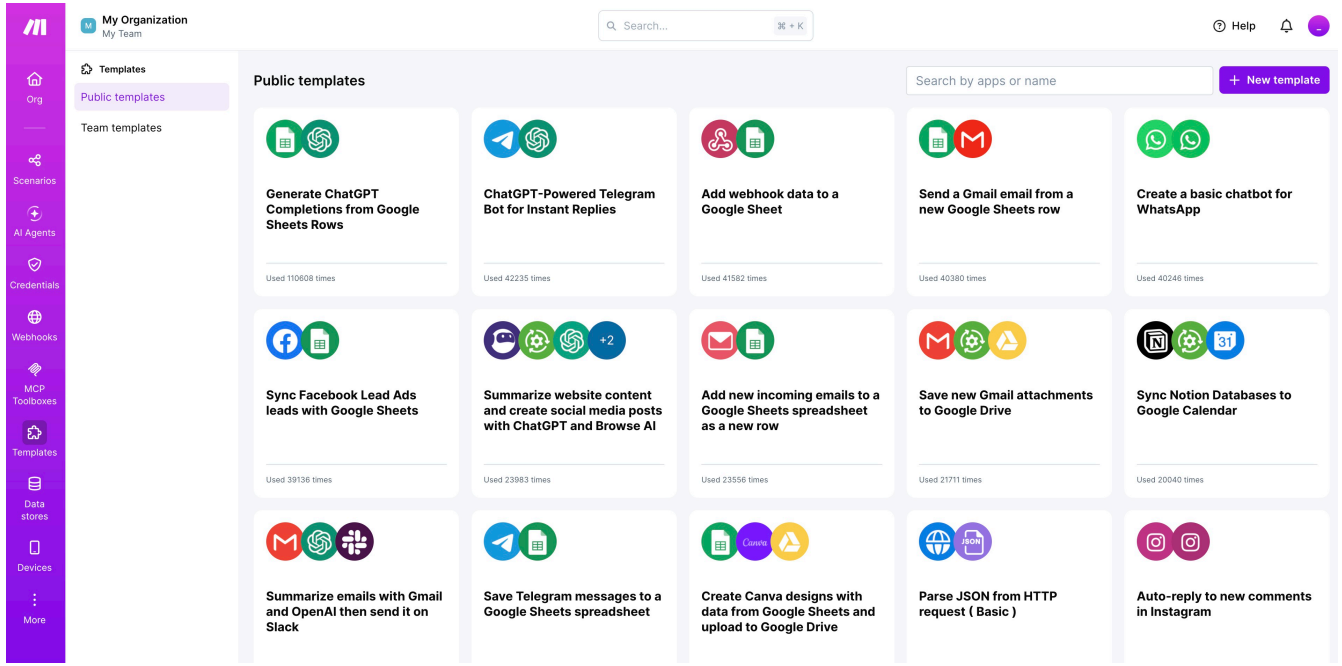

- Every dot has an input and an output
- Drag the previous output in as a block

This is the Make screen. Five dots, one line.

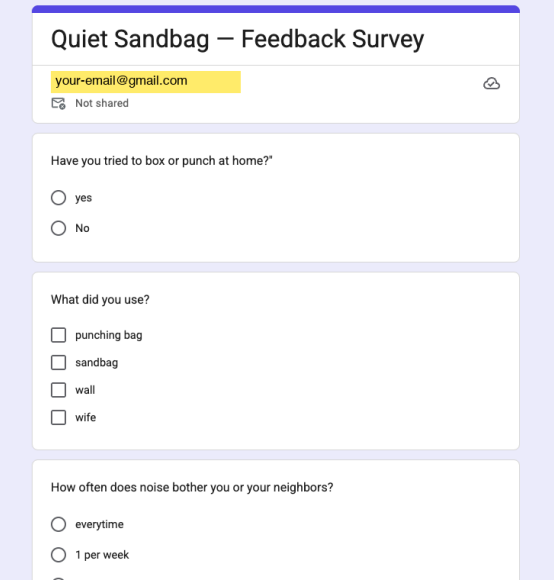

- Five dots
- One line

Pick a template. Just connect your account

- Pick one
- Connect only your account

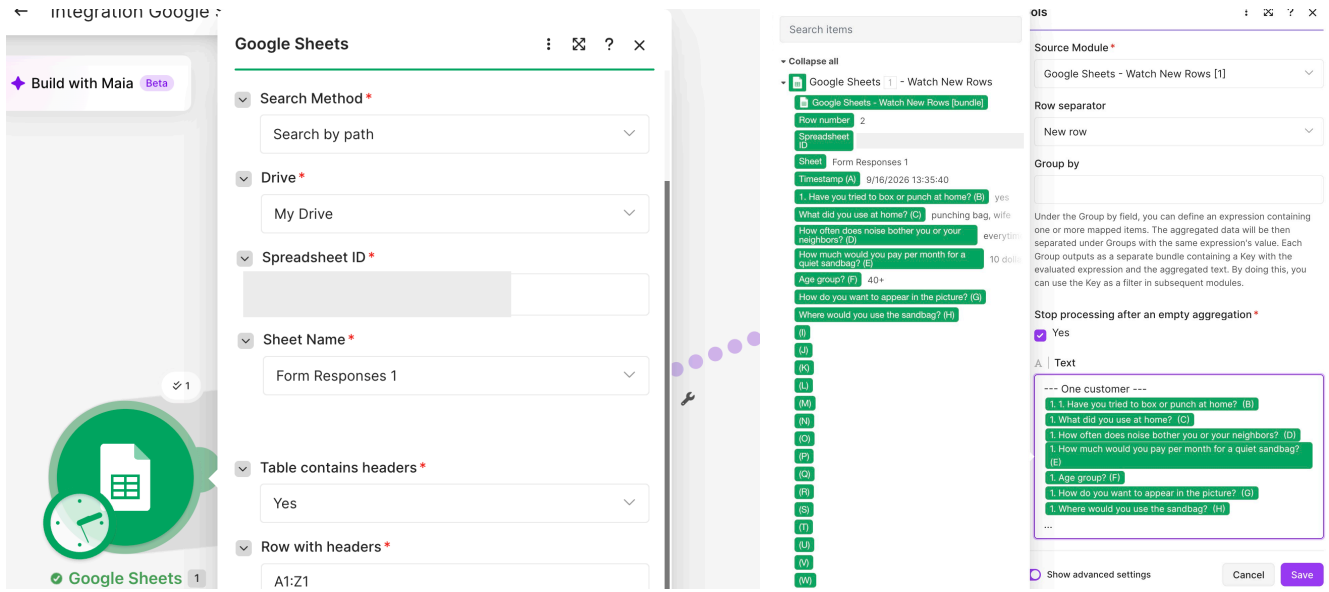

Create a survey.

Form_Responses

	A	B	C
1	Timestamp	Have you tried to box or punch at home?"	What did you use?
2	9/16/2026 13:35:40	yes	punching bag, wife
3	10/14/2026 1:29:56	yes	punching bag
4	10/14/2026 12:33:58	yes	wife
5	9/16/2026 13:35:40	yes	punching bag, wife
6	9/16/2026 13:35:40	yes	punching bag, wife
7	9/16/2026 13:35:40	yes	punching bag, wife

Just choose where and how many rows.

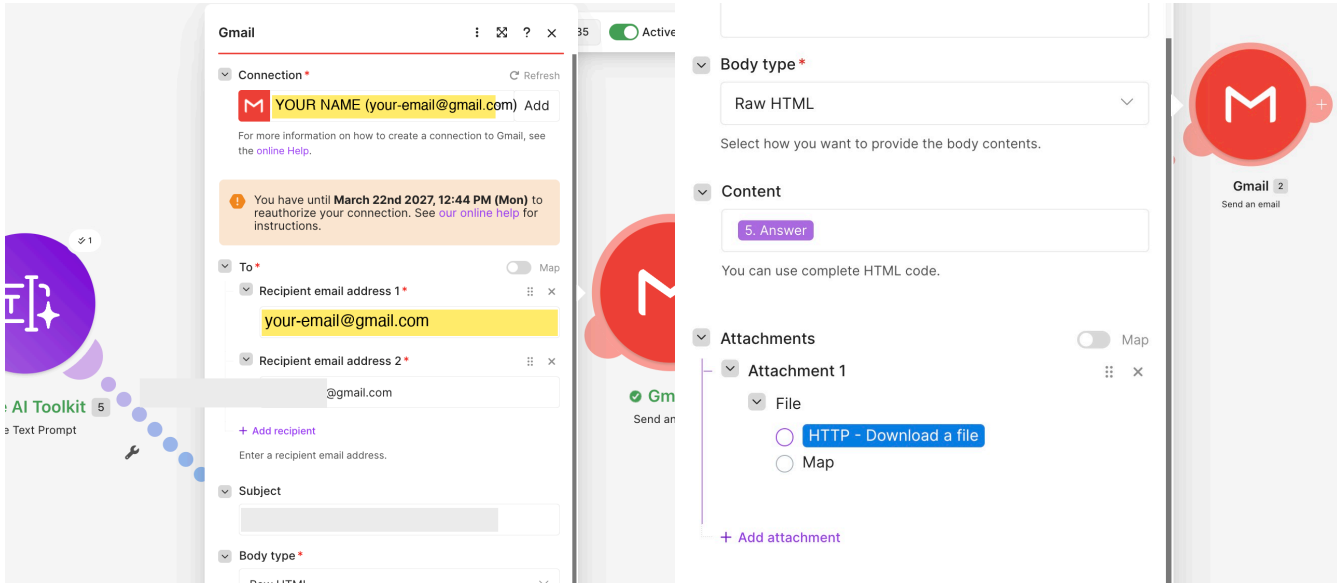

- Which sheet, which tab
- How many rows at a time — 10

Instruct it in plain words.

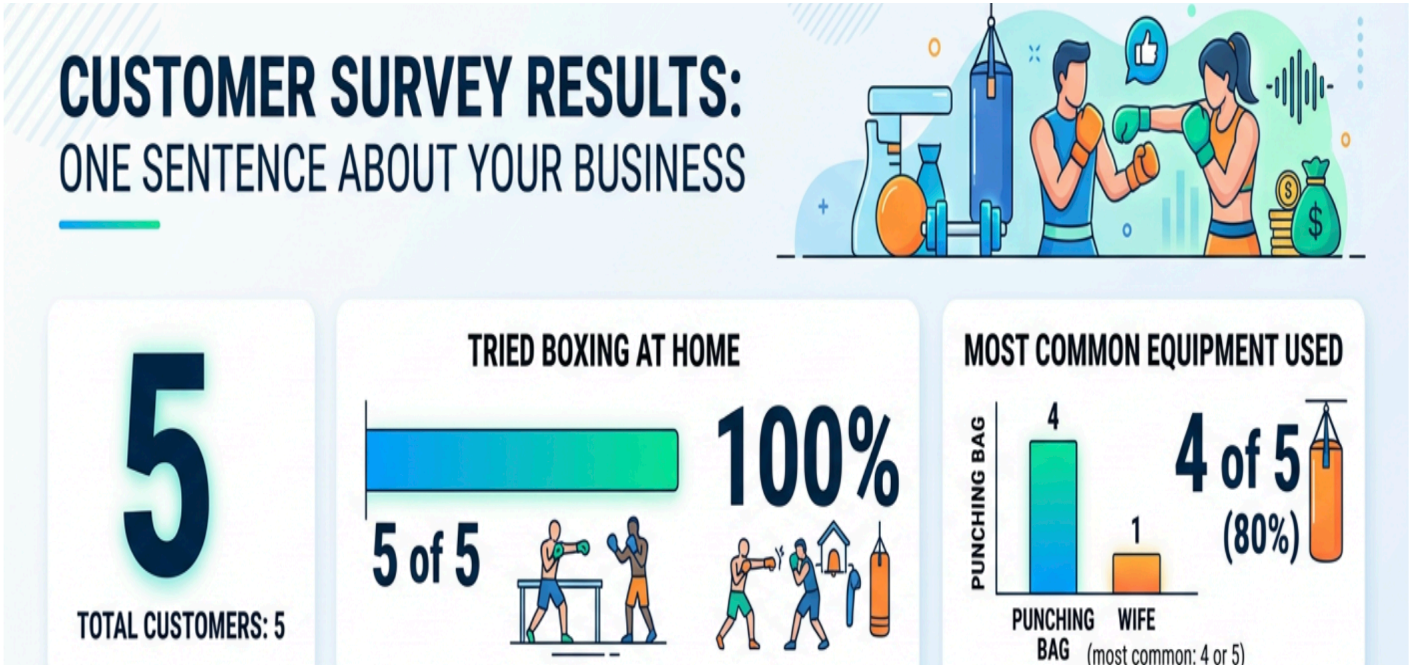

- Tell it in words — count, group, write 3 lines
- Pick a model — answers vary a bit

Just set recipient and subject.

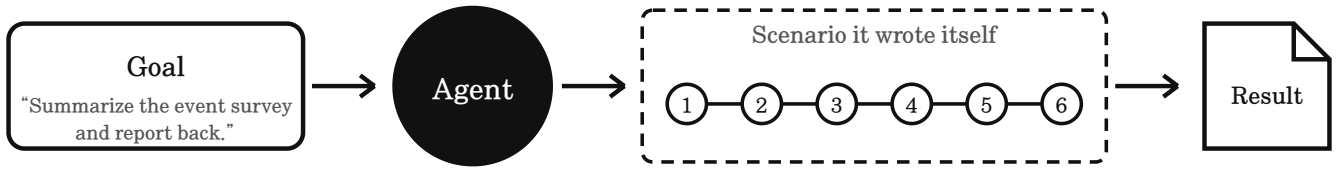

- Recipient · subject · body
- The chart goes in as an attachment

Run once — and the email arrived.

- One email: report + chart
- Human hand: one click on “Run once”

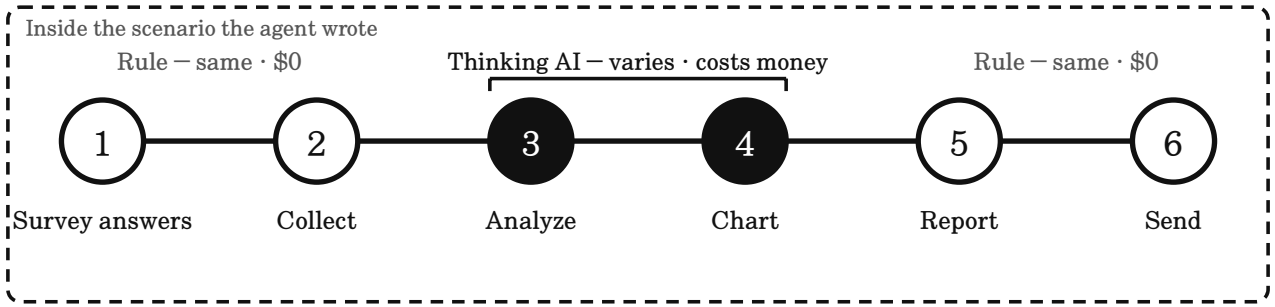

The agent connects the dots. You give the goal.

Humans give only the goal — the agent writes the scenario, runs it, and brings back the result

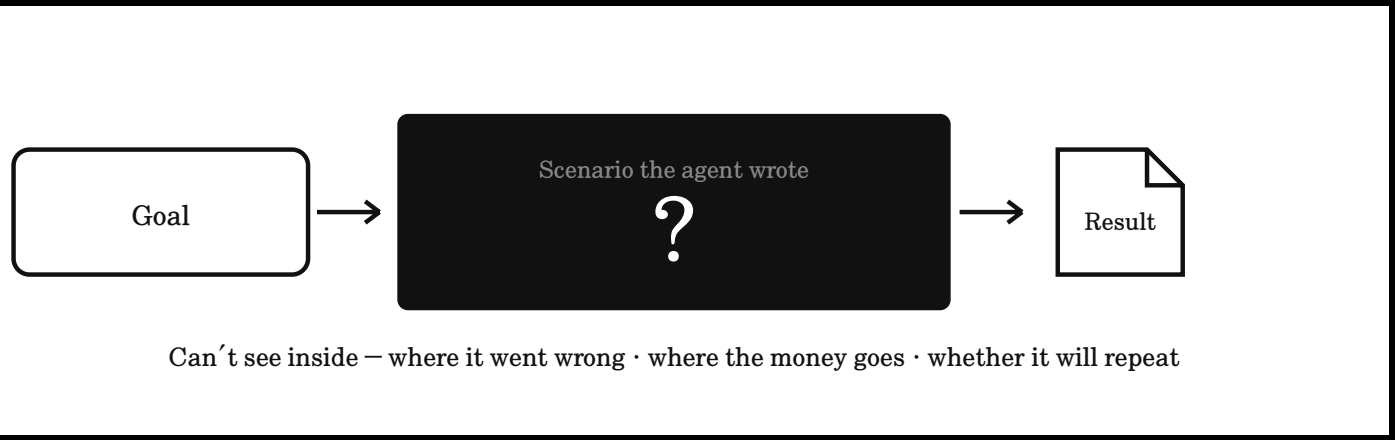

- A human gives one goal — "Summarize the survey for me"
- The agent writes, runs, and returns the result

Only two kinds: rules and thinking AI.

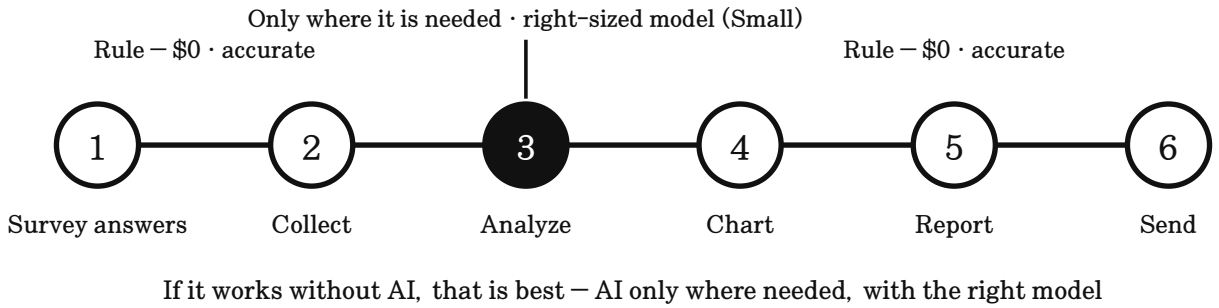

- Rule dots — same answer every time · $0
- Thinking AI dots — different every time · costs money

Can't see inside? Can't fix or trust it.

- You can't see where it went wrong or where the money goes
- Vibe coding has the same problem

No AI needed? Best. Otherwise, a right-sized model.

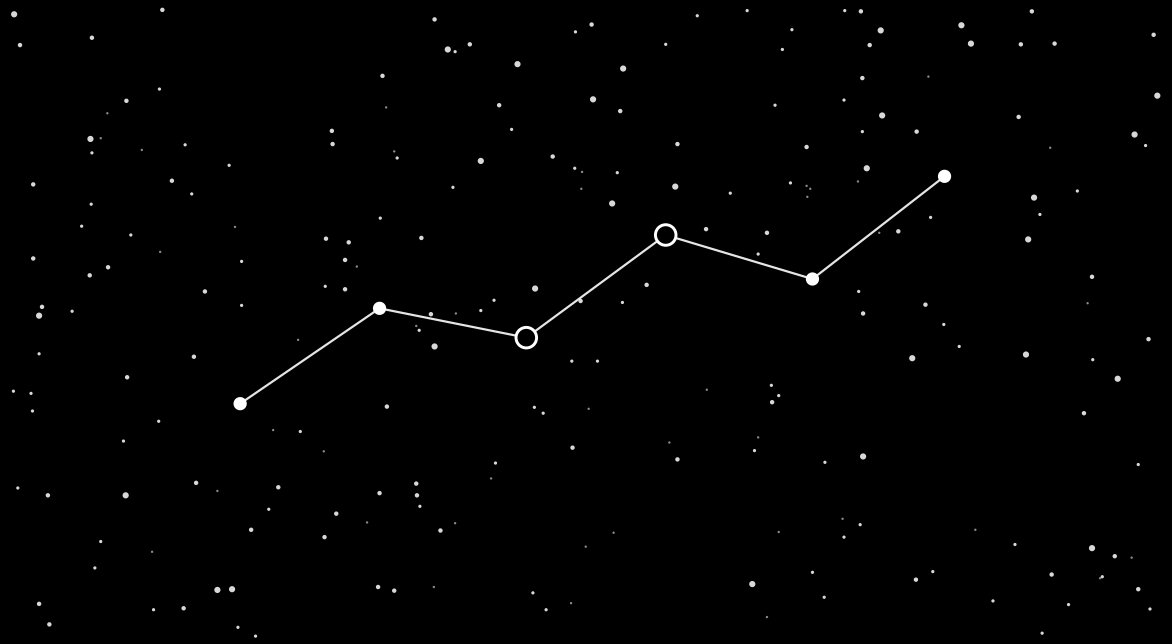

- If rules can do it, use rules — $0, accurate
- AI only where needed, right-sized model

A Question to Think About

Build the rule? Or break the rule?

What dots will your automation connect?

- Tonight, design it under the night sky
- Thank you
